

10 best apps for platforms

Here are 10 most popular applications that we recommend for you to be able to operate on different platforms.

Network Administration - From Windows, Linux to Mac and vice versa, companies are getting harder and harder to use only applications that work on certain platforms . As a result, we need to have applications that can operate on different platforms. Here are the 10 most popular applications that we recommend that you can do.

1. Firefox

There is no doubt that Firefox is the most popular browser that can work on different platforms. Neither browser has captured the throne of this issue from Internet Explorer as Firefox has. A browser that can operate on multiple platforms becomes necessary, and more applications and services require online management. Increasing the popularity of browsers that work on different platforms like Firefox has helped ensure that companies don't lock their sites and services into a browser.

2. OpenOffice

Applications like OpenOffice allow unbearable users of Microsoft Office to function in an enterprise environment. OpenOffice is one of the core products of the open source community and is one of the key applications that can work on all existing platforms.

3. TeamViewer

If you want to perform support activities, you will certainly know the importance of applications that allow you to remotely access another computer. There are many such applications; Some of them can run on multiple platforms using inside the browser. However, only a few are truly standalone applications that work on multiple platforms. TeamViewer is one such application. For Windows, Linux, Mac, and iPhone clients, it is rare for a client or situation to prevent you from performing remote assistance.

4. Adobe Reader

We do not lack PDF readers. Although each platform usually has a unique set of PDF readers. But no product can provide good quality and ease of use as what Adobe Reader can provide. It is a standard for PDF, and for clients operating on different platforms, Adobe Reader is clearly the winner in this competition.

5. Chrome

No previous web browser has caused such an echo. Google Chrome not only makes a lot of buzz, it also makes the competition between browsers more interesting. Google Chrome is currently considered to be a fast-access browser (the Linux version has been tested for the fastest rendering on any platform), but this new Google browser is also quite stable, with expandable and works on multiple platforms like many other browsers.

6. Thunderbird

If you're looking for an independent email client and can work on any platform, look for Thunderbird. Thunderbird is an email client of authentic emailers. With its tabbed and attractive interface, you will see that no email client has a nice interface and can work on different operating systems. And like its cousin, Firefox, Thunderbird has a lot of plug-ins that make it more useful.

7. Apache

Apache is one of the most used Web servers in the world. You can use Apache on Windows, Linux, and Mac. Indeed, it really easily wins over many other web servers. And another top advantage that many users admire about Apache is free. Can other competitors compete with such an opponent?

8. MySQL Workbench

Although this tool is still new to the world, however, you will not see a better database administration tool that can run any of these platforms. This MySQL admin tool can work on all platforms. Although with some platforms, you must use development release. However, according to our experience, the development release of this product is also quite stable as the existing database administration tools.

9. VMware

Although a fan of VirtualBox (the product can also run on multiple platforms), indeed VMware can be used on platforms for any reason. From a user who wants to experience other operating systems to big business activities, VMware can do a lot of other things. It is a paid product but the fee you pay is very valuable for what you get from it.

10. VLC

You will hardly find a more useful and flexible media player utility than VLC. VLC can currently work on Linux, Mac, Windows, * BSD, UNIX, Solaris, . It can *play* almost everything and even operate over the network. VLC is also an open-source, free product.
