

# 10 reasons to use iPad 3G instead of Wifi

Some customers are anxious between choosing the Wifi version of the tablet or waiting to buy the 3G version. And the answer is: Please wait for the 3G version.

***TipsMake.com - Apple is preparing to launch 3G version of iPad on April 30. Some customers are anxious between choosing the Wifi version of the tablet or waiting to buy the 3G version. And the answer is: Please wait for the 3G version .***

Apple is planning to offer iPad 3G on April 30 to pre-booked customers as well as customers who want to buy iPads at retail locations. The release date of the product has been determined, it is time for customers (who have ordered the iPad before) to consider what version of iPad they really need. This is indeed a difficult decision. Both devices have its advantages, and the choice of equipment depends on the purpose of the customer: in terms of price, choosing a WiFi-only version can be an option. good. With hesitating customers, the new iPad 3G is the right choice. Users will be able to exploit more features from the 3G version than the Wifi version. Maybe the 3G version will be more expensive, but the iPad 3G will be the best choice for both consumer and business customers.

And here are 10 reasons:

## ***1. Simply because it is 3G***

iPad 3G allows users to connect to high-speed Internet anywhere with AT&T 3G network. This is really important. Currently, Wi-Fi iPad users can only connect to the Internet whenever they are in a wireless connection. That means they can't check emails in cars or in parks. Without considering other factors, 3G connectivity gives users the options that the Wifi version does not have. This is an extremely important point of iPad 3G.

## ***2. Towards the future***

Although Apple will support both versions of the iPad, 3G is the embodiment of future consumption. What Apple and the designers are giving iPad is still in secret. Possibly, the company will give users new features, exciting new applications to meet the needs of both customers. But over time the greater possibility is that Apple will only apply improvements to the 3G version. The same strategy also happened to the iPhone when it tried to attract customers to buy the latest version of the mobile phone. What will prevent the company from doing so with the iPad?

## ***3. Higher efficiency***

If a customer plans to use the iPad not just to surf the Web, the 3G version will be the best choice for this customer. As Apple has stated many times before, it wants the iPad to be able to replace current mobile computers like netbooks and other lightweight laptops. Users can edit documents, create sheets and perform many other tasks. If you can connect to the Internet in any location with 3G connectivity, users will be able to work more efficiently. Therefore, using a WiFi-only version will be similar to using a desktop or other standard laptop.

## ***4. Businesses will benefit with iPad 3G***

Although the iPad seems like a personal customer-focused device, there are still some useful features for employees of businesses. This device has mobility features, using virtual keyboards and thanks to 3G connectivity, employees can work online at any time of the day. If a business wants to use the iPad to work, the 3G version is the only option.

## ***5. More applications***

Part of the value of owning an iPad is access to Apple's App Store. Because the iPad lacks some applications, the App Store quickly becomes a trusted place for customers to find functions that Apple has not yet included in this device. In many cases, that means a connection to the Internet is needed to make the application work. When users are at home, there will be no problems with Internet connection via Wifi, customers can use those applications. But when there is no Wifi connection, 3G will be the solution to help iPad perform the functions as expected by customers.

## ***6. More GPS functions***

Unlike the WiFi-only version of the iPad, the 3G version has full GPS functionality. As soon as the user launches iPad 3G, GPS satellites will perform the positioning function. In contrast, the Wifi version only determines the user's location via Wifi connection. Although 'more distorted than nothing', the Wifi version cannot determine the exact location at a specific time for users of location-based applications. This may not be an important point, but according to the popularity of the latest location services, more and more users want to determine the exact location for the rest of the world.

## ***7. Conditions to buy iPad 3G are more open***

Another attraction of the iPad 3G is that users are not forced to make combinations when they buy products. Therefore, if users decide that 3G will be a useful product while they are currently using the Wifi version, they can still buy another iPad 3G. If or they decide they want to connect to the Internet via 3G, they only need to pay US \$ 15 per month to get 250MB of data or US \$ 30 per month to get unlimited data. And they can stop using

this service at any time.

### ***8. Wifi-only version will not be supported for long term***

If you look at the history of Apple's mobile products, it is clear that obsolete models will soon be replaced by new products with more feature versions (for example, of iPhone 2G). The iPhone 3G has more new features, and Apple seems to want to direct users to the newer mobile version. iPad will not be an exception.

### ***9. Time factor***

iPad 3G is 1 month later than the Wifi version. That is really important. We still haven't forgotten that the WiFi iPad is having trouble connecting, but Apple is still trying to fix it. It doesn't mean that the 3G version is in the same trouble, but the fact is that Apple has known it for a month now, and it can completely fix it and apply it to 3G. The Wifi version may be a great product, but the 3G version will definitely be even better.

### ***10. Because it's Apple***

If Microsoft is offering two different versions of the same product, choosing a lower quality product is not a bad idea. Microsoft often supports products until the company should not do so again. But Apple does not. Steve Job made it clear that for every product Apple sells, the more expensive version will receive more support than the cheaper versions. This makes sense for Apple because it will earn more from expensive models. Moreover, retrofitting the desired features for the new versions will help Apple attract more customers. Apple doesn't like less-featured products, and this will become even clearer with the WiFi-only version of the iPad.
