

10 tech habits you should have

Maybe you've heard people tell you to back up computer data or you need to have a more secure password. Good technology habits are not just for geeks, they can save you money, keep your personal information safe.

Maybe you've heard people tell you to back up computer data or you need to have a more secure password. Good technology habits are not just for geeks, they can save you money, keep your personal information safe.

10. Regularly check your personal settings on social networks

You probably already know that social networks like Facebook have no room for privacy. Therefore, the only way to keep your personal information secure is to check your security settings regularly and periodically.

9. Know when you paid too much for a product

Technology equipment is not cheap but it does not always make you smooth, if you know how to spend money properly for technology. There are many things you do not necessarily have to spend such a large amount of money. Think about buying a used device but the quality is still good so you can save a significant amount of money for your wallet.

8. Keep the screen, hard drive clean, neat

When you put too many things on your desktop, it will take a long time to find a file, even if this is the reason your computer is slow. The advice of experts is to make the habit of arranging computer monitors and hard

drives always neat and tidy.

7. Avoid getting malicious code

We all know viruses are bad, but many of us do not know exactly how to avoid viral infections. In this case, the best way is to install an antivirus software program on your computer .

6. Use secure Wifi in public places

When using Wifi in public places, your computer may be in danger and be the subject of attack by hackers. Besides, when using the same Wi-Fi network, not only you but also many people are accessing this network, so they can access your data. Stay safe when you are using public Wifi by turning off sharing and using SSL whenever possible.

5. Be wary of any fraud, spam on the Internet

The Internet is full of scams, scams and other misinformation that sometimes you may not realize. This is really dangerous. For example, a fake email from a bank requires you to provide personal information and from there bad guys can use it to steal money.

In many cases, it is not dangerous but it bothers and wastes our time. Therefore, in many different ways, you should try to avoid being a victim of Internet scams.

4. Know what your computer needs (does not need) to maintain

We know a principle that, after a period of use, all machines need to be maintained and maintained. Therefore, in order for your computer to work properly, you need to regularly back up your hard drive, delete temporary files, delete programs you don't use .

3. Backup computer data

You can hear people say millions of times because this is one of the things to do for computer users. You may think, data loss will not happen to you. However, nothing can be said in advance. So, do this immediately and you will find it is not useless.

2. Use secure passwords

Even if you think you have a secure, possible password, you are wrong. Yesterday's clever tricks don't protect you from hacker attacks today. Saving a password into a web browser is not a safe way because anyone who uses your computer can access the password provided.

Therefore, you often change your password, so choose a password that combines numbers, both letters and capital letters.

1. Search Google professionally

With the proficient use of search skills on Google, you will get the information you need, effective instructions without anyone's help.
