

2 shortcomings almost genuine smartphone would make people bored

Smart smartphones now have big, beautiful screens, along with innovative designs that give users great experiences but everything has its advantages and disadvantages.

Smart smartphones now have big, beautiful screens, along with innovative designs that give users great experiences but everything has its advantages and disadvantages. And most smart phones today have two disadvantages that any user is bored.

Big screen, beautiful

According to the current trend, most smartphones are designed with full-screen displays with OLED technology to provide a sharp and brilliant color range, wide viewing angle, power saving . Another important factor for technology companies Choosing an OLED display is a very flexible structure, so it will be easy to serve the design and bending needs of smartphones.

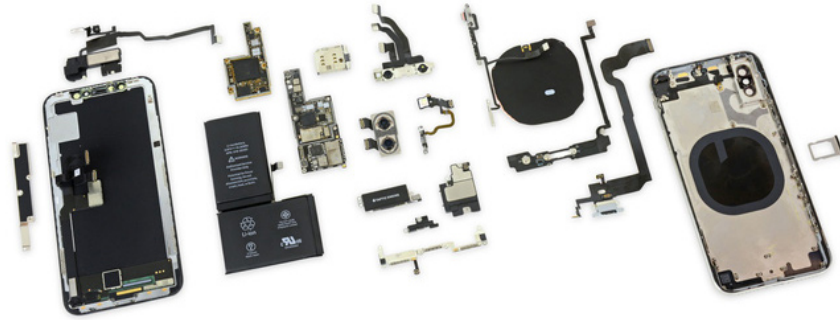

iPhone X has a screen almost all front.

But the screen is big and beautiful doesn't mean its durability increases. Extending the screen size to close and overflow will make them more prone to cracking and breaking whenever they touch points around the machine. In addition, basically OLED panels are thinner than LCDs (traditional screens of the previous day), so they will be more easily affected.

Easy to crack, hard to repair and expensive

Today's smartphones are sophisticatedly designed, more complex than before, and are difficult to separate due to the monolithic structure. This makes them very difficult to repair, recover if broken or if possible, the replacement cost is not cheap at all.

It is very difficult to remove all smartphone items like this.

The most specific example is the iPhone X package's warranty package price, which is approximately one-fifth of its price. Five years ago, Samsung's Galaxy S4 won a convincing score of 8/10 on repair, but Samsung's most advanced Galaxy S9 at the moment is only rated 4/10.
