WiFi Map is the leading Wi-Fi finder app, and for good reason. With over 150 million hotspots in its database worldwide, there's hardly a place that WiFi Map doesn't know about. The app acts as a social network for anyone with Wi-Fi, sharing passwords and adding new hotspots, creating a constantly growing database of accessible networks. You can even use the WiFi Map website if you prefer to find hotspots on your laptop.

What sets WiFi Map apart is its offline functionality. You can download maps for specific cities or regions before you travel, meaning you don't need an internet connection to find your next hotspot. This feature alone has saved you countless times when you land in a new country without a local SIM card.

Recommendation >

If you have an iPhone, WiFi Around is a great option for finding Wi-Fi hotspots. Like WiFi Map, the app relies on crowdsourced data from users who share and update their Wi-Fi information. What makes WiFi Around worth considering is its focus on providing real-time information about network availability and performance.

WiFi Around uses Apple Maps for navigation and supports widgets for quick access from your home screen. You can see nearby hotspots without opening the app, and it also shows real-time availability for some locations, so you know if a coffee shop's Wi-Fi is working before you walk in.

1. Get Wi-Fi Around (Free, \$4.99/month or \$34.99/year)

## **WeFi (Android)**

WeFi was one of the first apps to help people find public Wi-Fi networks, and even after more than a decade, it's still going strong. WeFi takes a unique approach by automatically connecting you to known, secure networks as you move around. Once you connect to a network through the app, it remembers it and automatically reconnects the next time you're in range.

WeFi's interface is minimalist but still useful, with a map-based view that shows available Wi-Fi hotspots near your current location. The app is particularly good at finding hidden networks that other apps might miss. It uses crowdsourced data but also proactively scans for available networks, often looking for business Wi-Fi networks that aren't widely advertised.
