

# 3 ways to play Java games on your computer

If you love java games and mobile apps and want to run them on your computer, try one of the following three emulator software. The emulator software allows users to run .jar files for mobile phones on computers.

If you love java games and mobile apps and want to run them on your computer, try one of the following three emulator software. The emulator software allows users to run .jar files for mobile phones on computers. Now you can play mobile games and even use mobile applications like Opera Mini on Windows computers. These emulator software perform the same task but in different ways and depending on user needs.

1. 10 best Android emulator software for Windows

## 1. MidpX emulator software

Perhaps this is the oldest emulation software on this list. Unlike recent emulators, it is not capable of running handler applications and has high resolution. Users can only run games and applications with a resolution of 176X220.

## **2. Sj-Boy-JavaEmulator emulator software for P C**

This emulator software is similar to MidpX but a bit better. It defaults to a Nokia N70 skin but can change this in options. Users can run most applications and even watch the BBC and some other websites run Opera Mini, take screenshots while the Java emulator is running.

### 3. Software emulator **Kemulator**

This is the best java emulator on this list because it has so many features that these emulator software cannot own. Users can run Java games or applications on any computer with any resolution, especially when setting the resolution and running it in full screen mode. In addition, Opera Mini 6.5 can be run with fast web surfing speed.

1. Which web browser is best for Windows computers?

Change the resolution and use full screen mode by going to **View> Options** . Users can set up any resolution but usually use 800 x 600. Kemulator can set up a proxy server for mobile Java applications.

**Note** : Cannot launch Kemulator from the shortcut on the desktop, unzip the content to the folder where Kemulator is installed and run kemulator.jar from there. Be sure to install the Java Runtime Environment on the computer.

**Download** : Kemulator
