

4 criteria choose to buy cool quality generator, good price

Generators help to operate machinery, maintain the operation of equipment when there is a sudden power outage, to avoid affecting labor productivity. Choose a good generator? That is the question of many people. Here are the criteria for selecting good generators, cheap prices not to be missed.

Since its first introduction in 1831, generators have made a huge breakthrough, bringing convenience to human life, both in the agricultural and industrial sectors. Generators are capable of generating power to promote devices, machines operate more smoothly and efficiently, helping people save energy. It can be said that this is a useful and important product not only for households but also companies and factories . If you are wondering whether to choose one generator for the best, then It is impossible to ignore 4 important criteria below.

What is a generator?

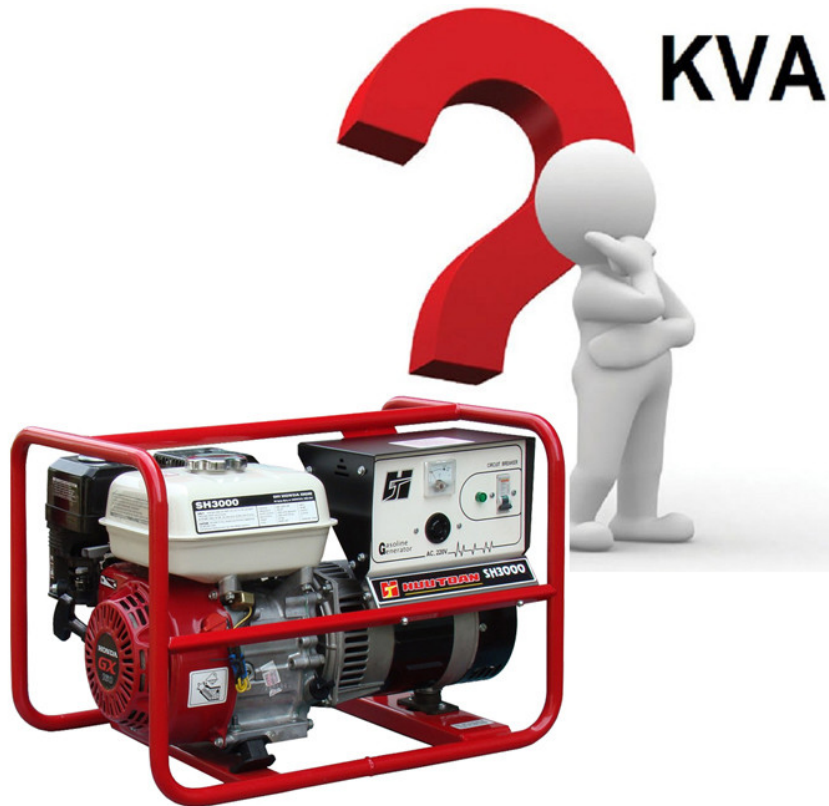

Electric Generator (English name: Electric Generator), is a device capable of converting energy into electricity through the working principle of electromagnetic induction. The first generator was the Faraday disc, which was born in 1831 by a British scientist named Michael Faraday. Today, generators are used in many jobs and life to bring convenience to users.

To learn more about the principles of generator operation, readers can refer to the article: "What is a generator? Operation principles and guidelines for safe use".

Here are the criteria to evaluate a good generator that you should choose.

Criteria to choose to buy a good generator

Operation capacity of the machine

When buying a generator, you need to choose to buy a generator that has a large or small capacity depending on your needs. For households and equipment that need to use less electricity, it is only necessary to select a type of generator with a small capacity. If you only need a generator to light up, use a fan and turn on the TV, you need only small and medium power from 2 to 4 kW. If you want to use more power-consuming devices such as air-conditioners, you should choose a larger capacity from 4 to 6 kW. The machine should have a safety factor of about 1.1 to avoid electrical overload. Should not choose generators for families with too high capacity, because it will lead to high costs, fuel consumption and ease of life.

For agencies and organizations that consume large amounts of electricity, it is necessary to use generators with a large capacity to ensure operation capacity, avoid overloading, short-circuiting, burning devices connected to the machine. power generation.

Fuel consumption

Choosing a generator that runs an explosive or gasoline-powered generator is a better question for many customers when buying generators? Normally, gasoline generators are always maintained at a stable level. When operating gasoline generators, noise is limited and quieter. It is designed with a compact design, easy to move when using. In addition, anti-burn protection is safer for users.

Oil generators are more complex, so they are usually fixed in one location and are often used when there is a large demand for electricity. The type of diesel generator is more expensive than gasoline generator but when used less damaged and simpler warranty is required.

Reliability and stability

As mentioned above, there are 2 types of gasoline generators and oil generators. Each type has its advantages when used separately. Based on your use needs to choose the right machine.

Usually when used in households, people often choose gasoline generators because they have a compact design, are easy to move in many different locations and moreover, they operate very smoothly. As for agencies and organizations, people often use generators running diesel because this machine has a large generation capacity and rarely fails.

Keep away from unidentified generators

Consumers who want to choose quality products are cheap. However, if you choose a generator of unknown origin, no warranty paper, then even if you save the initial cost, you will also spend billions of other repair and replacement costs. The reason is that unknown devices will not ensure safety for household electrical appliances. Moreover, the machine can be very fuel and electricity. Besides, the type of generator that is not guaranteed or used will cause loud noise, causing trouble for your own family as well as neighboring neighbors.

Where to buy generators?

To buy quality generators, you should choose reputable facilities, addresses or brands, clear origin, warranty paper. You can refer to one of the following addresses:

Hanoi: No. 56, Pho Duy Tan, Dich Vong Hau, Cau Giay - Hotline: (024) 3785 5633.

Ho Chi Minh City: 716 - 718 Dien Bien Phu, Ward 10, District 10 - Hotline: (028) 3830 8569.
