

4 things to consider about security with Facebook

Facebook is creating a lot of interesting and interesting ways to share information, links ... besides new features like Instant Personalization.

TipsMake.com - Facebook is creating a lot of ways to share information, links . very new and interesting besides new features like Instant Personalization . However, it is this trend of widespread information sharing that continues to create problems on social networks. Concerned about this issue, Electronic Privacy Information Center and 14 other groups of client protection lawyers submitted complaints about Facebook's confidentiality to the Federal Trade Commission.

Facebook is an effective tool to connect and share photos and news to friends, so users need to understand how Facebook uses user information and these usage policies of Facebook. How to change over time. Here are 4 reasons why users should care about Facebook's privacy policy.

1. 'Backward' security policy

The Electronic Frontier Foundation has an interesting statement on its Deeplinks blog, which shows that Facebook's security policies are going backwards: instead of keeping user information private, Facebook is increasingly publicizing the This personal information.

For example, in 2005, according to EFF blog, user information cannot be viewed by outsiders unless this information belongs to '*at least one of the groups specified by the user in the settings. security*'. In 2006, public information included 'schools, special local areas and other reasonable community limits announced by Facebook'. In 2007, publicly available information included '*user name, school name, and thumbnail images of content in profile*'. In November 2009, public information was noted by a third-party search engine and in December 2009, public information included '*user name, photo of personal information, name Friends books and favorite sites, gender, geographic regions and networks*'. These are quite strong changes for Facebook in just 5 years, although some of these changes may be due to Facebook becoming increasingly popular, or because Facebook has new features and services. However, it will be interesting to wait and see how much personal information users will get on Facebook over time.

2. Security settings are quite complicated

Facebook allows a special level of control over the information that users do not want to publicize, but this control is not easy. For example: Facebook has a section of privacy settings that are 'Friends, Tags and Connections' which control the types of information about other users that appear on the user's site. But to control user information that others can share, users need to change these settings in the sections 'Applications and Websites'. These sections can appear logically if users are familiar with Facebook's security settings and are familiar with how social networks share users' information. But if a user is unfamiliar with those parts, it will take a long time to find them.

There are many complexities in Facebook's security settings, but in a positive way, they will make it easier for users to make their personal information appear on search engines. Third-party swords like Bing, Google and Yahoo.

3. " Connections " are not clear

Facebook gathers information together under a title called '*Connections*', including hobbies, friends and connections, and there is also the current city the user is living in. , home, family, relationships, networks, activities, interests and places. The problem is that Facebook is not entirely clear that '*Connections*' will include exactly what parts and which pieces of personal information will appear publicly. Facebook explains that as follows:

'Facebook allows users to connect virtually to any person or with whatever the user wants, from friends, family to the living city, favorite food store, good band. favorite movie. Because it takes two parts to make the connection, the security settings only control who can see the connection on the user's personal page. If the user is not comfortable with public connections then the user should consider whether or not to remove the connection.'

No item in Facebook's privacy policy explains exactly what '*Connections*' are. For example, Facebook did not say all the content included in '*Like and Interests*' is connections, so this information is public. Facebook should clearly announce what connections are and where they appear on users' personal information pages.

3. It is increasingly difficult to give up ' Likes and Interests '

Facebook wants to enhance ' *Likes and Interests* ' on personal information pages by connecting to other real websites on the Internet. For example, if a user likes a movie page on IMDB.com, there will be a link from that site created that reconnects to the Facebook page. The problem is that Facebook's new interface makes it difficult for users to remove ' *Like and Interests* '.

For example, when accessing movies Knight and Day on IMDB and users love this movie, a link will then be created on the user's Facebook page. Now, to delete, the user will not be able to simply move the cursor and press the Backspace key to delete as for text. Instead, users need to select the movie title, then click ' *Remove* ' in the left column. Then, if the user wants to remove ' *Likes and Interests* ', the user has to repeat the above process for each individual favorite and delete part by part. Facebook does not provide a method to make the process simpler and easier, and there is no way to delete multiple information at the same time.

Facebook offers customers new and interesting services, but as more and more information on Facebook is publicized, users need to stay alert to get their information online. How this society is used and users can protect or delete such information at will.
