

## 4 tips to prevent fake attacks

In this article, I will show you some ways to fix fake attacks on recent Gmail, Hotmail and Yahoo email services:

**Network administration - Recent phishing attacks prompt users to need new security measures** . Old tactics such as not opening email attachments or clicking links from untrusted sources are not enough to combat intentional phishing attacks.

In this article, I will show you some ways to fix fake attacks on recent Gmail, Hotmail and Yahoo email services.

### **Friends' addresses are not always a reliable source**

People need to ask questions for certain types of emails, such as emails sent from banks that want to verify user names and passwords. Recently fake attacks against Gmail users are done as if they were sent from your friends or family members or colleagues. Its trick is to trick the open victim to attach and click on the link to access the fake login page.

### **Sometimes we are powerless**

At the end of May, Trend Micro discovered a Hotmail vulnerability that could compromise user accounts by previewing an email. Malicious email, especially email targeting individuals, has enabled a script that can steal

emails and contact information and then forward new emails to another account. Microsoft has now patched this vulnerability but only if the attacks are done in the real world.

In attacking Gmail, phishing attacks used a vulnerability in Microsoft's protocol to analyze users' antivirus software. In this way, an attacker can transform their code to avoid detection and hijacking of a victim's computer.

## **Try to fake birth trying to fake another**

Security researchers suspect that attempting to tamper with a target if successful can be the source of subsequent attacks on the same user and they will become more dangerous because the attacker can acquiring personal information and what is given will be more convincing.

## **You can be safe**

Recent phishing attacks against Gmail, Hotmail and Yahoo users are believed to target specific people, including government politicians, political activists, journalists and military officers. team. The attacker used personal information and specialized code to target individual individuals.

## **Using tips still applies**

In addition to using antivirus software to detect attacks, users should search for spelling or grammar errors to discover the credibility of an email source. If you click on an external link, be careful about the URL; Some sites are designed as if it were Google, Yahoo or Microsoft but the web address will tell you the truth. If you suspect an attack, check your email settings to see if the email is forwarded to your email address. And if you're using Gmail, you can enable two-step authentication mode for more security.
