

5 interesting improvements of Hotmail

This summer, when Microsoft made an update to its e-mail service, several Hotmail features would be refreshed and definitely more useful.

TipsMake.com - For years now, it seems that people have not seen any improvements in Hotmail. But this summer, when Microsoft made an update to its e-mail service (Windows Live Hotmail), some Hotmail features would be refreshed and would be much more useful .

Similar to Bing, it seems that Microsoft is not satisfied with just copying some features from its competitors, but also finding other convincing ways to help users interact effectively with email. Here are some interesting new points for Hotmail:

1. Inbox Views

New Inbox Views helps users filter favorite content in the inbox. The most useful feature here is probably ' *From contacts* ' which only displays email from users in the contact lists of users. Users will see which messages really need to be answered, and this is especially useful when users must regularly work with people in the contact list.

In addition, the new Inbox Views also has a function to filter new updates from social networks like Twitter and Facebook. There is also a feature to filter emails with photos, documents or emails with updated content.

Of course, users can create some filtering features on other services like Gmail, but many people will not want to do so. Microsoft has realized what users want and automatically provides users.

2. Sweep

In addition to real spam messages (such as Viagra ads and other porn ads .) there are also semi-spam messages (such as those previously registered by users and then no longer needed, or bonus coupons at stores where the user no longer buys. Of course, users can find out how to not subscribe to newsletters or register for coupons. But with the Sweep feature of Hotmail, users can remove the above troubles even more easily by selecting the sender and choosing to delete all emails of this sender or automatically transfer them to another folder if like to keep without disturbing the inbox.

3. Active View

Active View is really an interesting function. For example, the user receives an email from a friend including a video from YouTube, the content talks about an unexpected destruction in the ground. Users will not only get a link to that video, but also a thumbnail of the disaster video and open the video on a popup window to the right of the inbox. Besides YouTube videos, Hotmail also supports Hulu videos.

Active View also supports photos. If users receive photos from friends, the thumbnails of these photos will appear in the email. Users can view the thumbnails on the same window or click on these images and view them in slideshow format on a pop-up window.

Email senders don't need to use Hotmail or Active View, but recipients must install Microsoft Silverlight.

4. Edit the attached documents on Office Online

If users receive a Word, Excel, or Powerpoint document, Hotmail will allow users to open the document in online Office applications. Users can edit documents online, Hotmail will automatically upload this document to Skydrive (Microsoft's cloud-based storage site). After that, the user will have a link to the edited online document.

5. Integration with Bing

Not surprisingly, Bing, Microsoft's search engine, will be heavily integrated with Hotmail. The amazing thing here is how to interact with Bing and Hotmail. While composing an email, users can also insert information from Bing (for example, images, videos, showtimes and information about a movie, map data and information can be inserted). website information). A pop-up bar will appear to allow users to search documents with Bing. Look for that bar and click on the Insert icon below. Hotmail will put images, maps or other data directly into the email with a link to search results from Bing.

These innovations may not be attractive enough for users to switch from Gmail to Hotmail, but it is clear that they demonstrate the improvements that should be made and make the online email world more and more effective. fruit and more advanced.
