

5 mobile data management applications on iOS, Android

Users should monitor mobile data usage to avoid exceeding data usage. So this article will introduce you to applications that manage mobile data usage on both iOS and Android.

Users should monitor mobile data usage to avoid exceeding data usage. Among the two major mobile operating systems, Android provides users with an interface to monitor and monitor mobile data usage; on the other hand iOS does not provide much information. So this article will introduce you to applications that manage mobile data usage on both iOS and Android.

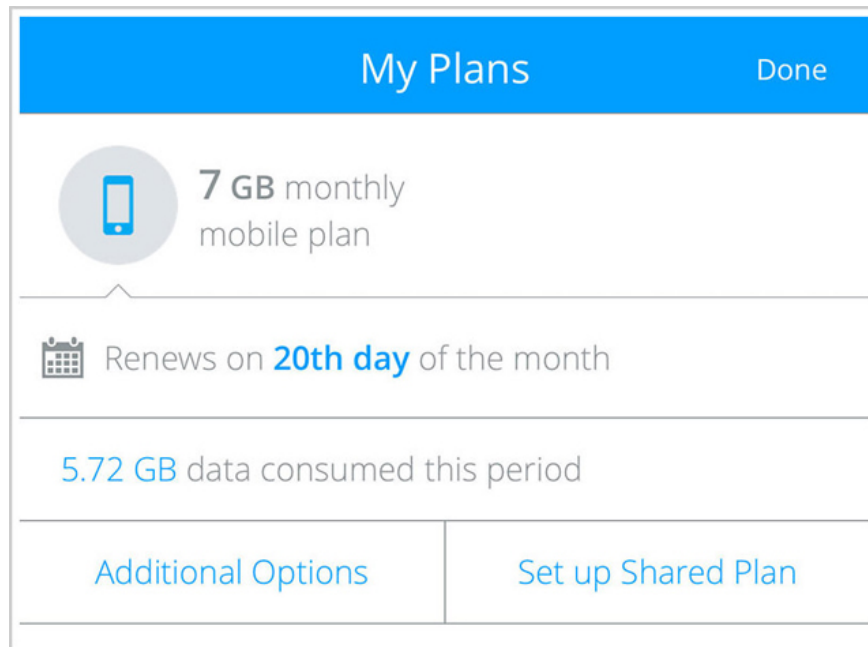

1. My Data Manager

Download My Data Manager for Android

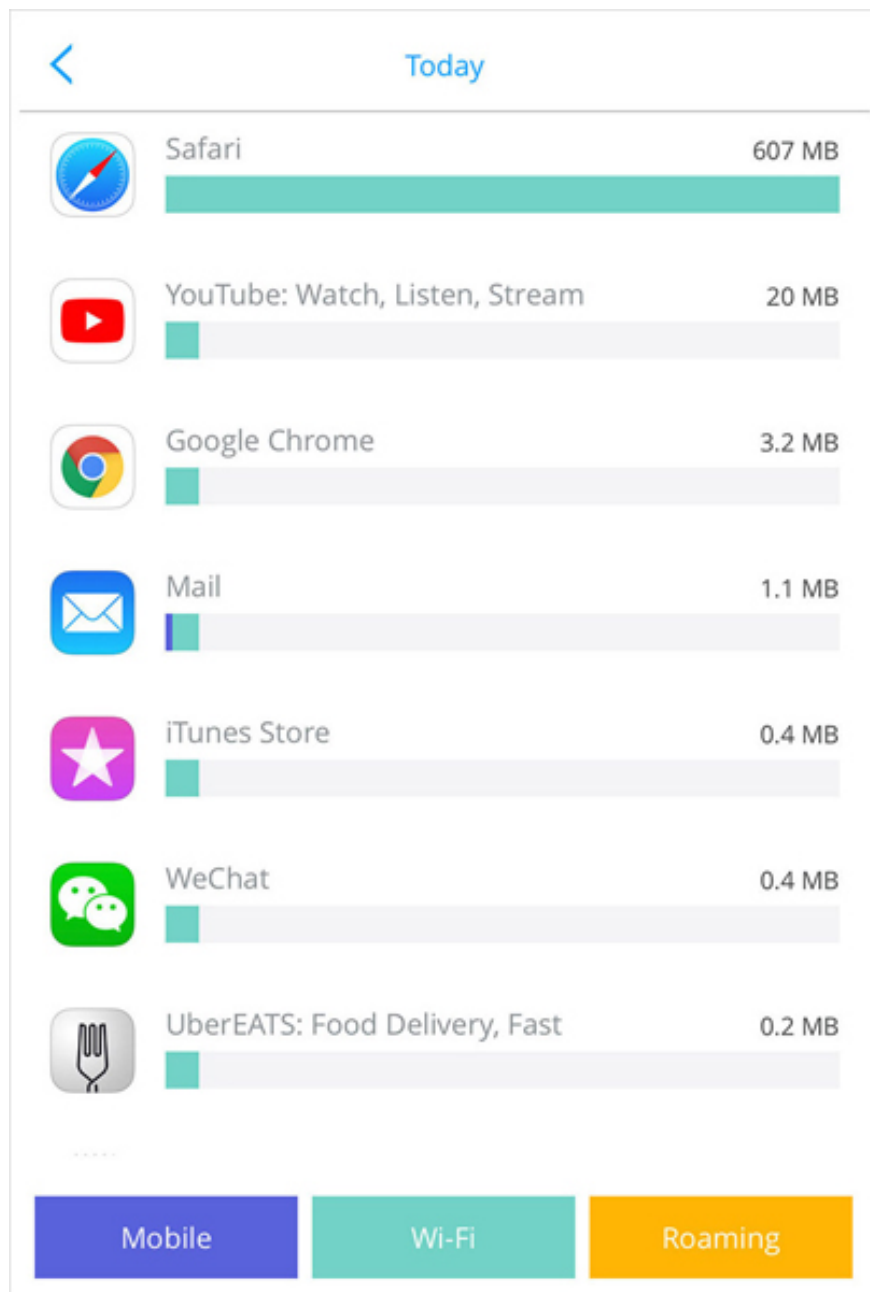

Download My Data Manager for iOS

My Data Manager is available on both Android and iOS. It is free, does not come with any ads and tracks data usage for mobile phones, WiFi and roaming. To use the application, simply enter the data limit, the renewal time and the renewal date.

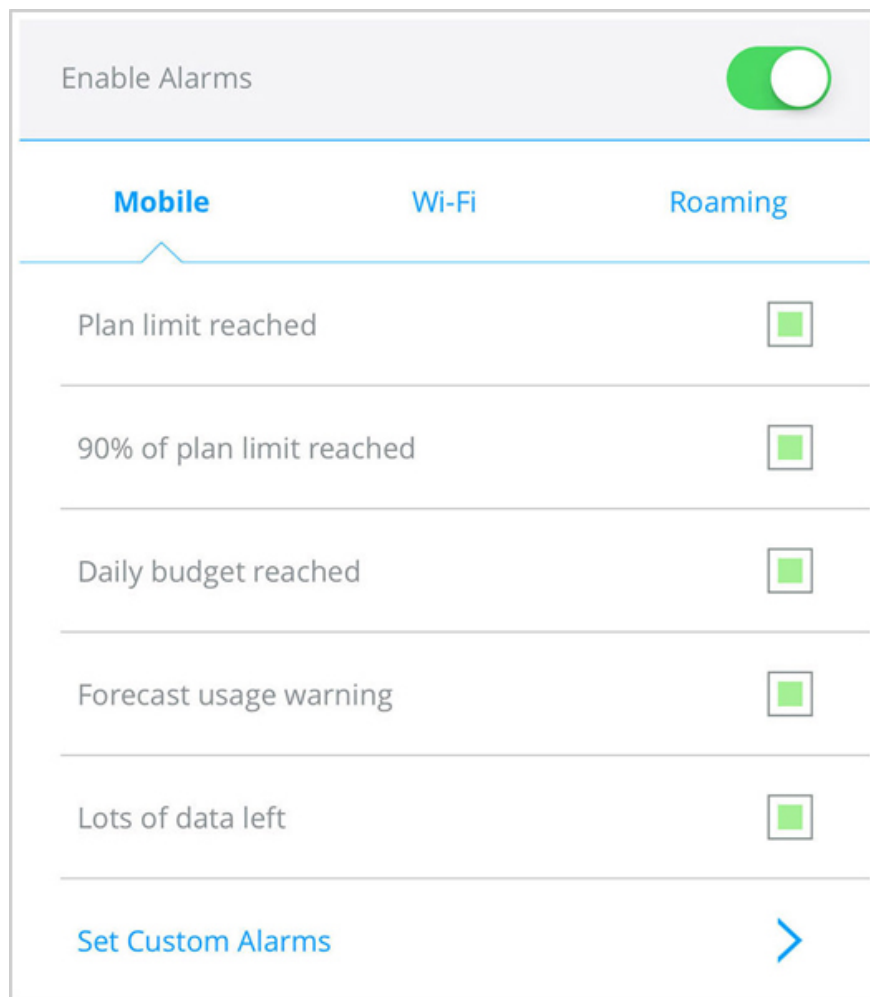

1. Instructions for using international Roaming service

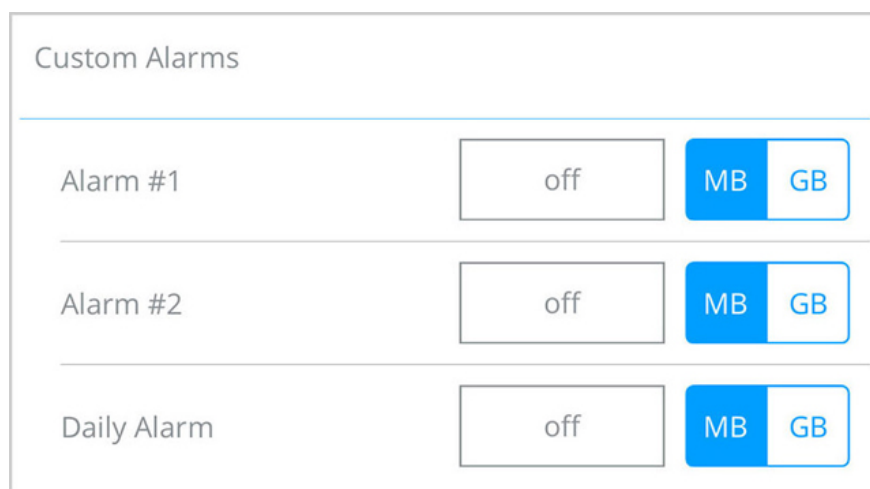

Now, switch to the summary tab and you will get an overview of data usage for mobile devices, WiFi and roaming (if available). The app tracking tab provides a list of applications that are using mobile data or WiFi. This helps you know how to adjust usage in case mobile data is close to the limit.

Another great thing about this application is the ability to set up warnings about data usage.

The " **Set Custom Alarm** " feature allows users to set alerts to notify when mobile data reaches a specific limit.

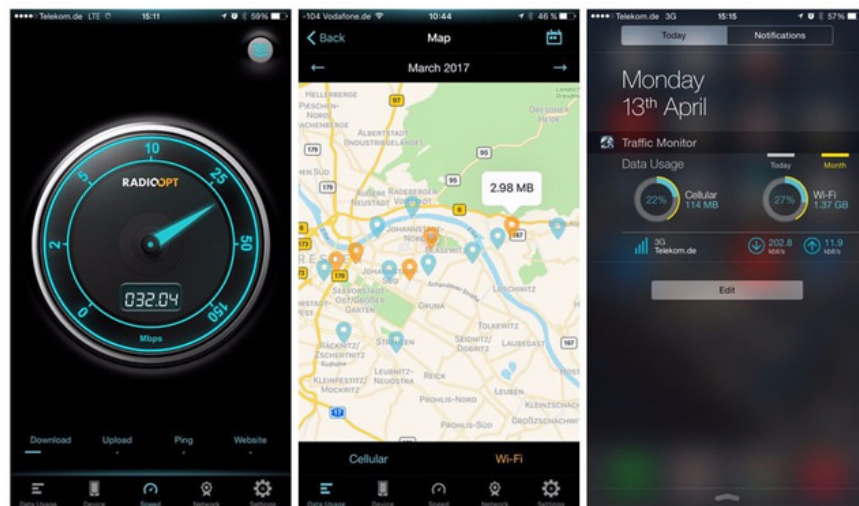

2. RadioOpt Traffic Monitor & 3G / 4G Speed

Download RadioOpt Traffic Monitor & 3G / 4G Speed ??for Android

Download RadioOpt Traffic Monitor & 3G / 4G Speed ??for iOS

Basically, this application is a combination of data usage tracker and data rate and speed checker. The application will help you maintain a stable wireless connection and also monitor the amount of data you are using.

You can specify the duration and limit of data packets and RadioOpt will monitor usage and alert you when the limit is exceeded. You will also not be surprised about roaming charges because it keeps a separate record of roaming data usage.

The application has a powerful speed test tool that helps users to check the speed of Wi-Fi or mobile data including upload speed, download speed and ping speed.

It can also create a coverage map to see where to get the best signal from the nearest network tower. All of these tests can be directly compared to those around you to see if you are getting the same speed.

3. Glasswire Data Usage Monitor

Download Glasswire Data Usage Monitor on Android

Glasswire, the popular network traffic monitoring application for this desktop computer, also has an application for Android devices. Like the desktop version, this application also focuses on monitoring network usage and recording application behavior.

It can track applications that are using mobile data, WiFi and notify you when you exceed the packet limit. You can track data usage in real time and even come back to see which applications have used the data on a specific date.

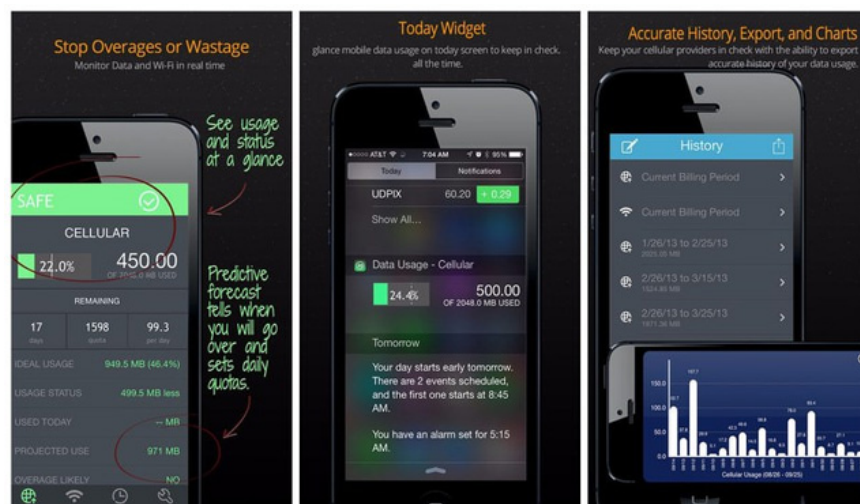

Glasswire also prompts users whenever a new application uses the Internet. If the data provider provides unlimited data usage for a specific application like Facebook, you can also exclude it from data monitoring.

4. Data Usage

The application tracks reliable data usage focusing on helping users use uniformly specified limits for a certain period of time. In addition to monitoring and warning of normal data, Data Usage also has predictive features for users to know when the data limit is reached based on their normal usage. If one day you use more data than usual, you will be alerted immediately.

Moreover, Data Usage has a dedicated utility that allows you to use data in real time and use it daily. In addition, the application also has the ability to disable data connection if the setting limit is reached.

5. DataMan Next

Download DataMan Next for iOS

A beautiful app with a compact design, DataMan provides only the features you need and works well. The application allows to track the data usage of each application and the process of limiting the overall data.

It also has a prediction feature that indicates when to exceed the limit based on current data usage.
