Instructions on how to access Advanced Options on Windows 10, Windows 8 and 8.1 quickly and simply, how to enter Advanced Options 100% successfully

Yes ! If you are using new versions of Windows, for example Windows 8, 8.1 or Windows 10, then perhaps the Advanced Options control panel is no stranger, right?

So what is Advanced Options? and how to access it? all will be in this article.

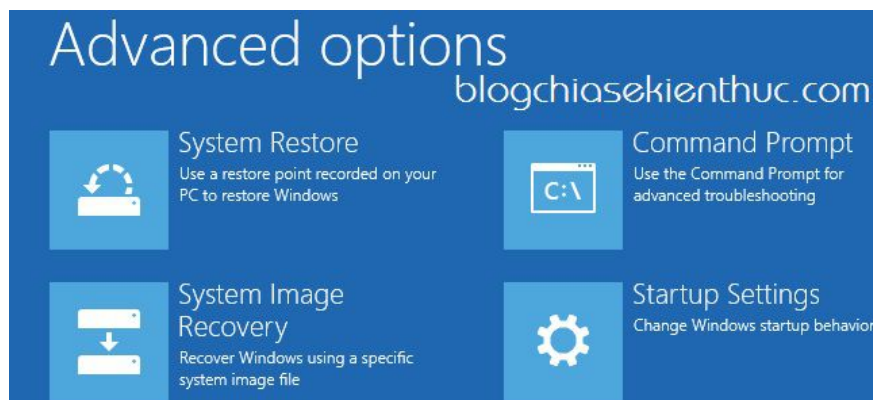

In this article, I will summarize the 5 simplest ways to access **Advanced Options** and ensure you can access and use it anytime, in any case.

Okey, first let's find out what features the Windows Advanced Options mode has.

I. What is Advanced Options?

Advanced Options on Windows is a control panel of tools that rescue the computer when Windows crashes.

These are tools built by Microsoft in the Windows installer to assist you in fixing, fixing, and troubleshooting as needed.

In some cases you don't need to find a way to enter this mode and Windows will automatically boot into it. For example the case:

1. Windows failed to boot, could not boot to the Desktop.
2. Windows boot failed 2 or more times.
3. Advanced Options can also be automatically accessed after two sudden shutdowns.

II. What can Advanced Options Windows do?

Here I will summarize through a few features in the Advanced options window:

System Restore : Restores the computer to that backup point (but before that the feature needs to be installed and set up before it can be used). However, I do not like this feature and also recommend not to use it.

System Image Recovery : Recovering the system using the System Image file. To use this feature, you must first use the System Restore feature to create a backup file. However, I recommend that you should not use this feature, instead you should use tools like Onekey Ghost, Norton Ghost or Acronis True Image to create a backup file that will be much more efficient.

Automatic Repair : **Automatic repair** mode on Windows, when your computer has an error, you can use this feature to preview it.

Command Prompt : Yes, access the cmd window to use commands. This feature is very useful and is also used the most.

Startup Settings : Some small settings, you can visit it to learn more.
