

5 Ways to Handle When Your Computer Cannot Enter Windows?

If your computer still turns on but freezes when you enter Windows. Let's learn with Hoang Ha PC about basic ways to fix this error at home!

Remove software installed before Windows error occurs

The problem of your computer not being able to access Windows may be caused by some strange software added to your desktop. This happens when the new software conflicts with an existing software on your computer, causing your computer to not boot. If you have previously installed a new software or application, try removing it.

How to remove software when you can't access Windows:

You access **Safe Mode** by pressing the **F8** key while booting the computer, in this mode the computer will not run the normal software that starts with Windows. You use the restore feature in this mode to go to the nearest backup point and remove the software.

Then restart your computer to check the results to see if your computer can turn on normally. If not, we will follow other ways.

Reinstall windows for your computer

An optimal way you can choose if you do not want to spend too much time editing is to reinstall Windows. This is a solution to return your computer system to its original state.

Method 1: Install Windows directly from the hard drive.

Method 2: Use USB BOOT with built-in Windows installation package.

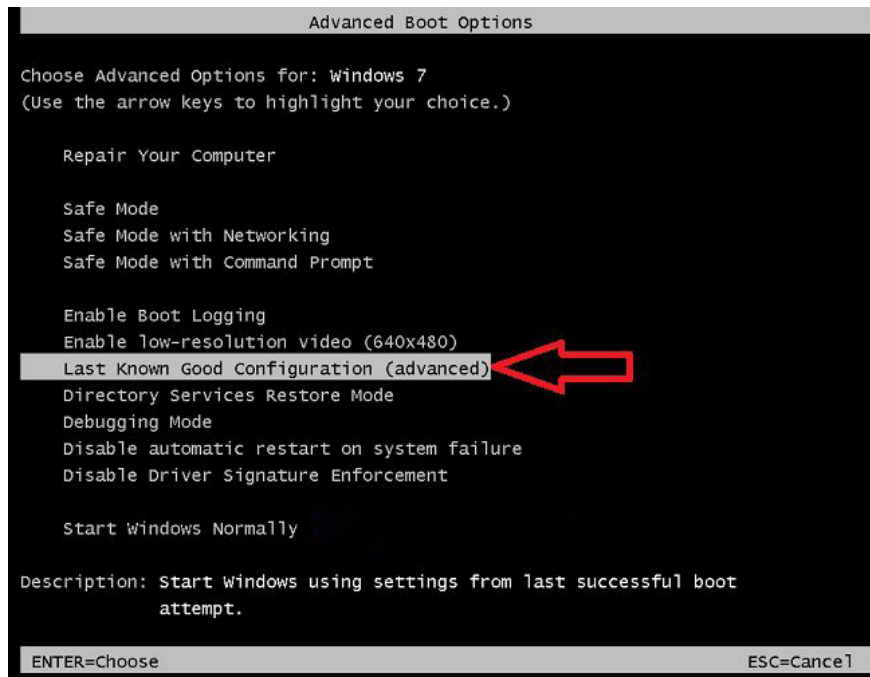

This is a commonly used method for ordinary users because we just need to reinstall Windows.

Using Last Known Good Configuration

A simpler solution you can try to fix the error when the computer cannot enter Windows is to use the **Last Known Good Configuration** feature .

First, you start your computer in **Safe Mode** . **When the Advanced Boot Options** panel appears , select **Last Known Good Configuration** (advanced).

Next, press **Enter** to perform the fix.

Fix computer not being able to access Windows by removing RAM, drive, hard drive

As mentioned above, the hardware components of the computer can also be the cause of this error. You can handle it in a number of ways such as:

Remove the hardware components you installed one by one and restart to see what happens. If your computer works normally when a component is removed, you can determine that the component is at fault. You can replace the problem component.

If your computer is connected to external memory such as USB, external hard drive. then try removing all of them and leaving only the mouse and keyboard. Then restart the computer to check.

Disable startup and system software

If you still cannot fix the problem of your computer not being able to boot into Windows, you can also try disabling the software that starts with Windows and the system. To do this, do the following:

Step 1: Access **Safe Mode** .

Step 2: Open the **Run dialog box** by pressing the **Windows + R** key combination => enter the command '**msconfig**' => press **Enter** .

Step 3: In the **System Configuration** window , switch to the **Startup** tab and disable all software and applications.

Step 4: Finally, click **OK** and restart your computer.
