

8 Unnecessary Apps for iPhone

There are many unnecessary apps installed on the iPhone because they do not have any function. Even when you delete these apps, the phone works better.

There are many unnecessary applications installed on the iPhone because they do not have any function. Even when you delete these applications, the phone works better. Below are some unnecessary applications installed on the iPhone.

Flashlight application

Flashlight apps were useful when the iPhone didn't have its own. But that changed when iOS 7 came out in 2013, which included a built-in flashlight app.

Additionally, third-party flashlight apps often contain ads, request access to data, and even track your data usage for mining.

QR code scanning application

Many people still download QR code scanning apps even though they already have them on their iPhones. The iPhone Camera app can automatically scan any QR code without collecting more data than necessary like third-party QR code scanning apps.

1. 4 simple ways to scan QR codes on iPhone

Battery saving app

Don't believe any battery app claims you see. Battery-saving apps on iOS don't do what they say they do. Unlike Android, iOS doesn't allow third-party apps to control battery usage at the system level. At worst, they'll run in the background, draining more battery and injecting ads.

Use battery saving mode on your iPhone to improve your device's battery performance.

Compass App

The iPhone comes with the Compass app built in, which is accurate, clean, and ad-free. It also has built-in location services and works offline in most cases.

RAM booster app

If you find your iPhone is slowing down, don't rush to download a RAM booster app. Apple doesn't allow third-party apps to interfere with the system. iOS already handles RAM efficiently in the background, closing unused processes and prioritizing active ones without any outside help.

Mirror App

In theory, Mirror apps seem useful. But in practice, they're just glorified shortcuts to the front-facing camera.

Just open the Camera app, switch to the front camera and you have a mirror to do the work you need.

Call recording app

Before iOS 18.1, you had to use alternative apps to record calls . Now, the iPhone has this feature built in, allowing you to record by tapping the icon in the upper left corner during a call.

Apple places strict limits on app access, especially when it comes to sensitive data like phone calls.

Antivirus application

Simply, with iPhone you don't need an antivirus app.

iOS is built with sandboxing technology, a security model that keeps apps isolated from each other and from the system itself. This makes it nearly impossible for a virus or common malware to affect a device like a Windows PC or an Android phone. Furthermore, every app on the App Store goes through a rigorous review process before it can be downloaded.
