Plex good almost Kodi. Plex possesses many features that can easily make you 'overwhelmed'. The platform's client-server architecture makes it the right choice to stream media through different devices. This allows the same stream to stream seamlessly across all supported devices.

If you're an Android user and want something that looks and works just like Kodi, this is the best option for you. SPMC is the abbreviation of Semper Media Center. SPMC was developed by Android manager for Kodi and

gives users the same feeling. Any Kodi compatible add-on works well for SMPC. Obviously, this is one of the best Kodi alternatives, especially when it comes to Android smartphones, tablets and smart TVs.

The biggest downside of SMPC is that you can't use it with iOS. Adding this will make SMPC the perfect copy of Kodi. Hopefully SMPC will have the version for iPhone and iPad soon. Emby calls herself an 'Open media solution'. Emby works just like Plex, removing the limitations of proprietary software. As an open source platform, Emby also uses the client - server mechanism. Emby makes media streaming super easy to all connected devices. There is also a live broadcast function in Emby, which allows you to play DVR recordings. Moreover, parental controls are an important component that makes Emby different from other platforms.

Interestingly, even OSMC is built on the Kodi model. You can call it the kodi version specifically for Linux. Put simply, OSMC works well with every Kodi add-on.

In addition to common things, OSMC also supports a wide range of WiFi adapters and TV tuners. The web-based user interface and ability to support the desktop environment shows that the platform is slowly gaining acceptance. Perhaps, this vision has helped OSMC to gain a lot of love from Lifehacker, Wall Street Journal and New York Times. Therefore, OSMC has also launched its flagship device, VERO 4K. The device supports HD audio, 4K video and 10-bit content.

## 8. Universal Media Server

2. **Price** : Free

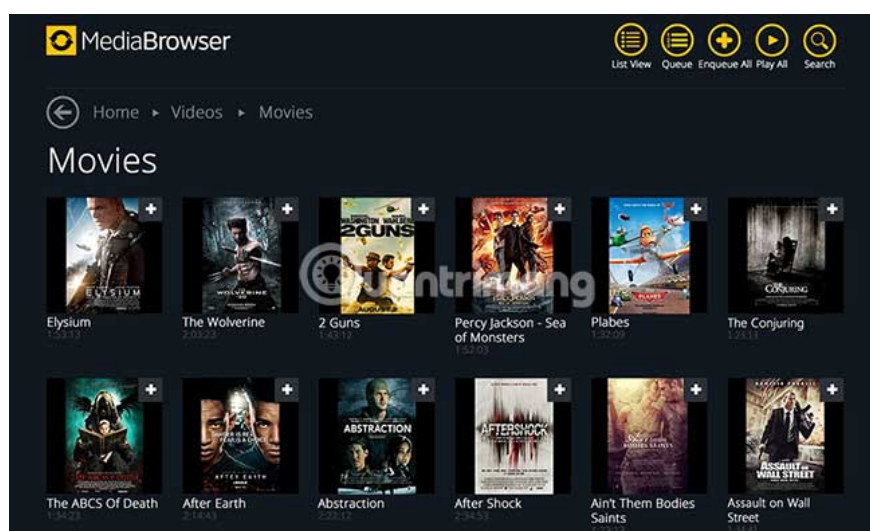

Universal Media Server is a simple media streaming platform, also compliant with DLNA. The user interface is very simple and can also be set up easily. This

media player can stream, transcode and play video, audio and images in several formats. Player features include bit rate adjustment, and of course, DLNA support.

Universal Media Players is also a 'classic' because it is Java based. In addition, there are quite a few plugins that are built in to the platform. Besides, you can also install a few plugins yourself. If that's not enough, you can even get more information about movies from IMDB and integrate the music database from MediaMonkey into it.
