

9 damaging the fastest laptop screen!

For some reason, if you really want your laptop to crash the screen (really sure you want it!) But don't know how to do it, then follow the ways below ...

For some reason, if you really want your laptop to crash the screen (really sure you want it!) But don't know how to do it, then follow the ways below.

1. Things to know about 4K computer monitors

Method 01:

Use your finger, or any sharp, sharp object to emphasize the screen. This is about 90% successful, depending on your "cruel" and "ruthless" work. If you're not brave enough, you can let your pet puppy or cat use its claws to scratch the screen.

Method 02:

Drop the screen from above to the ground, making sure not only the screen but also your laptop risk going to the second-hand store, or entering . the scrap store. Dropping from a higher position, and letting the screen touch the ground first, or the screen is in the open state, the greater the chance of causing damage.

Method 03:

Close the laptop screen, then stand or sit on it (as you like!), Do you see the screen sinking back when you're doing that? This concave is proportional to the possibility of damage to the screen.

Method 04:

Pour or splash food, coffee or soft drinks (with gas, mineral salts as much as possible!) Into the screen. If you do this while the device is running, the screen is lit, the screen will soon "die". If the screen is not broken, it will be white speckled like "skin disease". Touching your food-filled fingers on the screen also works equally well!

Method 05:

Pour water (or any solution, including glass cleaner) into slots on the four sides of the screen. In this way, you also have excellent destructive ability to add a keyboard or more.

Method 06:

Turn off the Screen saver mode and power saving mode in the operating system, then let the screen work 24 hours a day with a single color. Bright white is probably a very interesting option if you do it this way.

Way 07:

In your free time, you can close and open the laptop screen quickly and strongly and repeatedly. Sorry, this way can only . break or break the cables, and if you spend a little money to replace a new cable, the screen will probably work again.

Method 08:

Take your laptop to the garden and let the screen dry in the sun, or keep it next to the aquarium for humid, or to a place with lots of dust. When the screen is broken, no one can find out the reason for its failure, if you do it this way. If you don't have free time during the day, bring your computer to sit under a high-pressure lamp of the same day in the evening.

Method 09:

Take the computer repair kit, remove the screws, and open the screen to see how it is installed. At least after reinstalling, you can also make the screen no longer "stand firm".
