

A sample of Nokia's Meltemi operating system is available

Few people know that after the death of MeeGo, Nokia secretly developed a separate operating system that also uses the Linux kernel (similar to Android) with the name Meltemi.

Few people know that after the death of MeeGo, Nokia secretly developed a separate operating system that also uses the Linux kernel (similar to Android) with the name Meltemi.

MeeGo used to have a brother in the lower segment

Meltemi is an operating system developed by Nokia to replace *Symbian S40* on the low-end segment. With many unique features, Meltemi should have been able to save both the MeeGo upperclassman and the Nokia high-end segment. However, in 2012, *CEO Stephen Elop* officially launched Meltemi to switch to Asha platform - simultaneously cutting down on a number of positions in the Finnish company.

According to leaked information at the time, Nokia completed a prototype of Meltemi. The rumor has now been confirmed: a Nokia product collection group on social networks *vk.com* has revealed photos of Meltemi.

The leaked photos showed that the kernel of Meltemi was completed in June 2011. Later, the Finnish company never mentioned the name "*Meltemi*" through official channels. This is unfortunate, because the name Meltemi is very poetic: the north wind blows to the Aegean Sea. Unfortunately, these "*northern winds*" could not save Nokia: in the past year, the Finnish company has officially returned to Microsoft and the Nokia brand on mobile phones has also been killed .
