

# Adobe launches a mobile version of Photoshop

The application, called Adobe Photoshop Camera with AI integration, allows users to apply various filters and effects to edit photos in real time.

After bringing familiar applications such as Lightroom and Photoshop Express, Adobe is now adding another photography application to mobile devices.

The application, called Adobe Photoshop Camera with AI integration, allows users to apply various filters and effects to edit photos in real time as soon as users take photos to take photos, (i.e. before press the shutter button).

Following Adobe's introduction, Photoshop Camera helps bring 'Photoshop-class magic' to the camera on your smartphone.

Adobe said the Photoshop Camera application will be adding new filters created by artists and influencers in the future.

With this editing application, users can also change the background and add stickers to images in real time, and post edited photos directly to social networking platforms.

Photoshop Camera with the help of AI can observe and recognize what is happening in the image to suggest appropriate editing tools and effects, helping to automate complex effects that if done on photoshop will take hours.

For example, with photos of food, the application will provide a series of logical filters to help the product stand out, while with a landscape photo the application will give suggestions for optimal tools for editing the sky .

Adobe will officially release Photoshop Camera for Android in 2020. Currently, users can register early access to the application.

1. Adobe Photoshop full version officially launched on iPad, fully functional and Apple Pencil compatible
2. Adobe Aero officially launches, promising to bring the AR content creation experience on mobile devices to a new level
