

Alternative if you don't want to share your Wi-Fi password with guests

Giving them access to your main wireless network could give them complete, unrestricted access to all of your devices, which can be risky.

We often share our Wi-Fi passwords when we have guests over. However, giving them access to your main wireless network can give them full, unrestricted access to all of your devices, which can be risky. So to help secure your network and keep your devices safe, here's what you can do instead.

Some routers allow setting up guest networks.

You can use a mesh Wi-Fi system in your home to provide a seamless networking experience. The TP-Link Deco mesh Wi-Fi system comes with the Deco app to help you set up and control the system. One advantage of the app is that if you tap the **More** tab and select **Guest Network**, you can create a network that is separate from your main network but still allows visitors to enjoy the Internet connection at home.

When you enable the app's Guest Network feature, you can create unique name and password combinations to differentiate it from your main network. For example, you can create a Wi-Fi QR code on your iPhone to make it easier for guests to connect to the network.

If you don't have a TP-Link Deco Mesh router with an app, you can still check with your router manufacturer to see if your specific Wi-Fi router model has a guest network mode. You can also check your router's settings when setting up a Wi-Fi network on your new router to see if it offers a Guest Network feature.

1. Download Deco for | (Both are free)

Buy cheap router for customer use

If your current router doesn't have Guest Network functionality and you don't want to upgrade your current system, your next best option is to buy one of the cheap routers for guests to use. That way, you can just connect it directly to your modem and create a completely different wireless network for your guests. If you have a large home, you can limit yourself to one router and place it near where guests typically spend time, like the living room, dining room, and family room, rather than buying a more expensive mesh system that will cover the entire house.

Alternatively, you can buy one of the best travel routers and set it up when people come over. That way, you can use it while traveling and have more secure connectivity.

Setting up a guest Wi-Fi network helps keep your home network secure by isolating it and preventing strangers from accessing your devices. If your current router already offers this, you're in luck because you don't have to worry about spending extra money on additional equipment. But if not, the money and effort you put into setting up your own guest Wi-Fi network will likely keep you safe and save you a lot of trouble in the future.
