

# Android 8.1 will indicate whether WiFi is strong or weak before connecting

Android 8.1 will help you decide whether to connect to found WiFi via connection speed.

There are more features launched on Android 8.1 even after several weeks after launching an update to Oreo. Today, Google said Oreo will display the speed of open WiFi networks the device finds, helping to decide whether to connect or not.

The WiFi setting section will display 4 levels: **Very Fast** , **Fast**, **OK** and **Slow** - respectively Very Fast, Fast, Stable and Slow.

*View WiFi speed before connecting*

According to Google, the difference between Very Fast and Fast is that if the Quick network will stream most of the videos online, it is very fast to stream high quality videos.

Most WiFi in cafes and public places will be OK enough to browse the web, use social networks or listen to MP3s.

A private WiFi network that requires a password will not tell you the speed because you know you cannot access it and Google cannot check it randomly. Network administrators can also prevent WiFi Assistant from displaying speed by using 'Canary URL'.
