

Appeared 'ugly' virtual live application, automatically removing all human images from the scene taken

The application, called Bye Bye Camera, specializes in erasing all human images from the scene taken.

The application, called Bye Bye Camera, specializes in erasing all human images from the scene taken.

Bye Bye Camera is developed by an artist nicknamed "Damjanski" and two friends. He said that his application using artificial intelligence (AI) will identify and remove all human forms in the picture, draw a panorama without the presence of humans, even that is a selfie photo.

The whole process of "blowing" people out of the picture takes only a few seconds.

The artificial intelligence system (AI) behind Bye Bye Camera's "blow" ability is developed with a mechanism to identify and classify objects effectively and accurately. Not only does this erase the human image, this AI can even analyze the available background scene and then redraw the previously deleted blank, making the original photo look like no one is there.

Essentially, "context-aware" in graphics applications like Adobe Photoshop also has similar capabilities. The difference is that in Bye Bye Camera, this feature is integrated right from the moment of shooting button and users only need to wait a few more seconds to finish.

The original image is a bit complicated because of the shadow so it is easy to spot the difference because there are still details left.

Bye Bye Camera is now available on the App Store for \$ 2.99 and is warned to be slow and the ability to remove people is not perfect, sometimes there are still redundant details or pixels. If you lazy to practice complex

Photoshop on your computer, you can download and experience Bye Bye Camera following the link below.
