

Apple devices to avoid buying right now despite heavy discounts

Many users are being advised to stay away from certain devices at the moment as new names are about to appear.

Many users are being advised to stay away from certain devices at the moment as new names are about to appear.

Apple will be updating some new devices in the coming months, so users may consider delaying their purchases to have the opportunity to own new products or current versions at a more favorable price.

iPhone SE 3, 13 or 14

iPhone models like the SE, 13, and 14 currently strike a good balance between price and performance. The iPhone SE 3 stands out for its compact size and affordable price, while the iPhone 13 is known for its improved camera and the iPhone 14 for its low-light photography.

iPhone SE 4 has the same power as iPhone 16?

However, the iPhone SE 4 is expected to launch in the near future, promising to bring many significant improvements to Apple's cheapest iPhone line. According to sources, this product will have a larger screen, a new design and be equipped with the same A18 chip on the iPhone 16. This is a good reason for consumers to wait.

The iPhone SE 4 is expected to be introduced as early as this week. However, the launch date will depend on Apple's decision on whether to hold a product announcement event or just issue a press release as in previous times.

iPad Air M2 and iPad 10

The iPad Air M2 is equipped with an M2 chip and an 11-inch or 13-inch screen that provides outstanding performance. However, in the future, Apple may integrate an M3 or M4 chip into the new generation iPad Air, along with new features such as the Magic Keyboard, 90Hz panel, higher screen brightness and Wi-Fi 7 compatibility.

iPad Air M2 is about to have a worthy successor.

Meanwhile, the iPad 10, which will be released in 2022, impresses with its new design and 10.9-inch screen, making it Apple's cheapest tablet. However, the iPad 11 seems to be coming soon and will be a huge leap in power thanks to the A17 Pro or A18 chip and the same price as the iPad 10. The iPad 11's launch date could coincide with the iPhone SE 4 launch event, or if it's later, it will fall around March.

MacBook Air M3

This MacBook Air model was released in March 2024 with an M3 chip and many improvements. But if you are looking for a MacBook Air, you should consider waiting for the new model with the M4 chip because the difference in performance and efficiency will be very noticeable. The M4 chip promises to deliver superior performance and energy efficiency compared to the M2 chip.

MacBook Air M4 to launch in March 2025?

Buying a device right before a new model is released can leave consumers feeling regretful. While the price of current models may drop, users will miss out on the improvements and exclusive features of the new products.
