

# Apple is producing Retina screens for the 13-inch MacBook Pro

Retina screens for the new MacBook Pro will be produced by Samsung, LG and Sharp starting in the third quarter to produce products in the fall.

**Retina screens for the new MacBook Pro will be produced by Samsung, LG and Sharp starting in the third quarter to produce products in the fall.**

According to sources from Apple's supply chain, "Apples App" is starting to produce Retina display panels for the current MacBook Pro. This panel is 13.3 inches in size for a resolution of 2560 x 1600 pixels. This information was also verified by NPD expert Richard Shim in *Cnet*.

Richard Shim also confirmed that the MacBook 13's Retina display will be manufactured by Samsung, LG and Sharp. The analyst also said the Retina display output for the MacBook Pro 13.3 inches may be higher than the current 15.4-inch version. *"The 15.4-inch version of Retina display is only a few hundred thousand units while the 13.3-inch screen number can be up to 1 to 2 million. Partners will start producing displays. This is in the third quarter"* - Richard Shim said.

13.3-inch Retina display is being produced.

However, output depends on the productivity of suppliers. Samsung often has less problems with producing Apple-standard screens than its competitors. This Korean company is also the first manufacturer to provide enough Retina display for Apple.

This product promises to be introduced by "Apples Apples" in the fall.
