

Apple officially launched its own operating system for iPad, multitasking features, support for reading files from USB, SD memory cards

So after many years of sharing iOS with iPhone despite having relatively different hardware and performance, the iPad will eventually have a new, separate operating system.

At WWDC 2019 developer conference event, in addition to iOS 13, Apple also officially launched iPadOS, a separate operating system for iPad tablets. So after many years of sharing iOS with iPhone despite having relatively different hardware and performance, the iPad will eventually have a new, separate operating system.

Over the years, Apple has improved and added many new features to iOS that make gestures on the iPad fall into an awkward situation. Therefore, developing a separate operating system for the iPad is a logical move.

iPadOS has a new Home Screen screen with widgets (like widgets that often appear in the Notification Center), expandable and scalable placed in the position next to the application icons.

iPadOS has added many new gestures to improve the device's multitasking capabilities, allowing users to switch between applications or drag and drop applications to the sides of the screen.
