

Apple will open iTunes for Android devices

Most likely in the future, mobile devices running Android operating systems will be able to access iTunes to use some Apple services.

Most likely in the future, mobile devices running Android operating systems will be able to access iTunes to use some Apple services.

Apple is said to be considering a plan for Android users to access iTunes

Billboard's page cited three Apple sources, saying that "apple houses" have seen the danger of fast growth of Android, so they are considering allowing Android devices to access iTunes, which is the exclusive online store for devices running iOS.

The purpose of Apple is to let Android users have access to iTunes to buy available digital music or video content, instead of having to buy in the Google Play app market.

Apple's latest iTunes version is iTunes 11, adding two *In The Store* and *Up Next* utilities.

In it, *In The Store* introduces music similar to the iTunes library, suggesting users to buy or listen to it. The *Up Next* displays three songs that will be played next in the random play list.
