

Apply these tips now for digital security in 2025

With just a few small tweaks, security performance will improve dramatically for 2025.

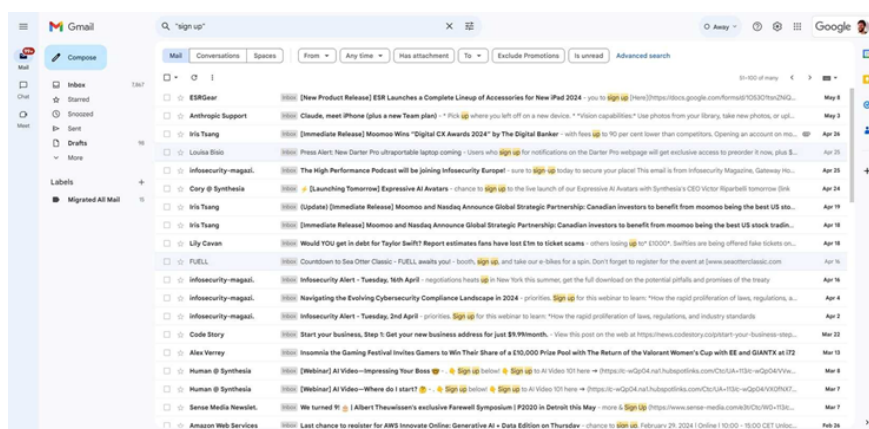

In the era of the internet boom, every network-connected device is at risk of becoming a target for cybercriminals. With personal data being collected widely and fraud methods becoming increasingly sophisticated, strengthening the digital security "shield" is more urgent than ever.

Here are some simple but useful adjustments you can make right now to protect yourself in 2025.

Clean up your online account "warehouse"

Have you ever wondered how many online accounts you've created over the years? Chances are, you have a huge cache of accounts that you've forgotten about. However, these old, forgotten accounts can make you easy prey for hackers.

Take the time to review and close any unused accounts and request that those services delete your personal data. This will not only reduce the risk of identity theft, but will also minimize spam.

Please clean up any accounts that have not been used for a long time.

Email alias - Effective security "weapon"

One effective way to protect your real email address from shady websites and services is to use email aliases. By creating multiple 'fake' email addresses, you can easily control the flow of information to your inbox, and quickly identify and block spam sources. Furthermore, if a service you signed up for with an alias is hacked, you can simply close that account without affecting your main email.

Enhance security with multi-factor authentication and passkey

A strong password is not enough to keep your online accounts safe. Enable two-factor authentication (2FA) whenever possible for an extra layer of protection. Better yet, switch to passkeys - advanced authentication technology that reduces the risk of phishing attacks.

Update router firmware

The router is considered the "heart" of the home network system, and regular firmware updates are essential to ensure the security of the entire system. The latest update not only fixes security holes but can also improve the performance of the router. So be proactive to do this to improve the security of your whole family.

Keep your router's firmware updated regularly to stay safe.

As we move into 2025, take the initiative to protect yourself by upgrading your digital security shield. With just a few small changes, you can enjoy a safer and more convenient online life.
