The new discovery shows that Arabian cat is a **recluse** cat, in danger of **extinction** in the Middle East. However, installing surveillance cameras at 1,990 square meters, about 150 kilometers west of the Abu Dhabi desert, the team from EAD and the zoo Al Ain suddenly found the Arabian cat breed still survive after 10 years of searching.

With bait traps, with food being thrown continuously for several months, the team captured 46 photos, of which two images of Arabian sand cats often appear at each moon.

Shakeel Ahmed, a member of the expedition, said he and his colleagues hoped these photos would provide more important evidence of the number of Arabian cats that have been living in the area.

It is known that Arabian cat cats found in sand dunes, desert cliffs, shrubs, they specialize **in eating rodents** in the desert and can survive at temperatures up to 52 degrees C.

In addition, seclusion, **appearing only at night** , in the desert is a hindrance, difficult for biologists to conduct surveys, study population, ecological behavior, and behavior This Arabian cat cat to build the sanctuary is safe for them.

There are just over 30 Arabian cat cats living in captivity at Al Ain Zoo, located at the foothills of the Jebel Hafeet Mountains.
