TipsMake.com - Recently, the number of computers infected with fake security software has increased significantly, especially those with the 2012 characters included, for example:

XP Antispyware 2012

XP Antivirus 2012

XP Security 2012

XP Home Security 2012

XP Internet Security 2012

Vista Antispyware 2012

Antivirus Vista 2012

Vista Security 2012

Vista Home Security 2012

Vista Internet Security 2012

Win 7 Antispyware 2012

Win 7 Antivirus 2012

Win 7 Security 2012

Win 7 Home Security 2012

Win 7 Internet Security 2012

However, the process of recognizing and destroying such destructive software is not as difficult and complicated as many people think. Basically, this entire work will be conducted in the following order:

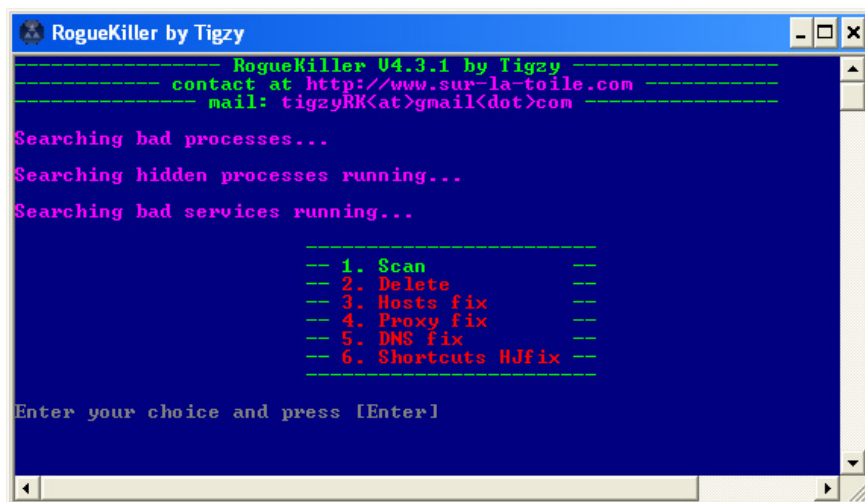

- Fix errors in Registry.
- 'Destroy' processes that are silently active and constantly generated by malware.
- Use tools that are capable of reviewing, detecting and recovering errors and vulnerabilities in the operating system.

Some tools you should use like:

- FixNCR is used to fix Registry errors.
- RogueKiller software to destroy automated processes generated by counterfeit software.
- Software supports Malwarebytes.

The first step is to make sure that the Windows 'Registry' system works correctly with the * .exe files working normally. If you have not completed this step, the infected files will continue to spread and affect other files in the system, so using future support programs will become meaningless.

The next step is to turn off the operation of automated processes generated by these fake programs using the RogueKiller tool mentioned above. Specifically, we conducted another test on **Microsoft Windows XP SP3** and **Windows 7 Ultimate SP1** operating systems, the results were very positive, the program detected most of the symptoms of the following fake software. when infecting the system, it is also easy to fix all the errors (mostly related to hosts files, proxies, dns .). First, download the **RogueKiller.exe** file to your computer, operating under **Administrator** in Windows Vista or 7:

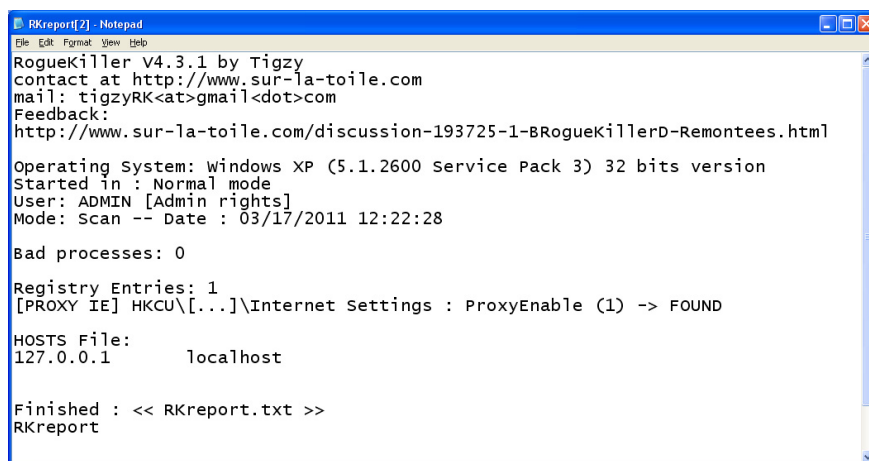

```
RogueKiller by Tigzy

mail: tigzyRK[at]gmail[dot]com
-----
Searching bad processes...
Searching hidden processes running...
Searching bad services running...

-----
-- 1. Scan
-- 2. Delete
-- 3. Hosts fix
-- 4. Proxy fix
-- 5. DNS fix
-- 6. Shortcuts HJfix
-----

Enter your choice and press [Enter]
```

The main interface of the program with 6 different options

Start with the first option - **Scan** to perform a system check and check, then refer to the information generated in the report file:

```

Operating System: Windows XP (5.1.2600 Service Pack 3) 32 bits version
Started in : Normal mode
User: ADMIN [Admin rights]
Mode: Scan -- Date : 03/17/2011 12:22:28

Bad processes: 0

Registry Entries: 1
[PROXY IE] HKCU\[...]\\Internet Settings : ProxyEnable (1) -> FOUND

HOSTS File:
127.0.0.1 localhost

Finished : << RKreport.txt >>
RKreport
```

To continue, install a security program that recognizes highly malicious programs, typically MalwareBytes, along with a quick update support file. After scanning the entire system (it is recommended to use the **Full Scan** option after the update), destroy the malware, fix the infected files and problems with the operating system vulnerability, You should restart the computer. With only 3 simple steps, the probability of our success is about

90%. And to ensure the computer system is absolutely safe, you should equip yourself with security measures based on the 'top' software in the world today such as PC Tools Spyware Doctor, Avira Antivir Premium, Kaspersky Internet Security, ESET Smart Security . Wish you success!
