**TipsMake.com - When asked about the highest risk present for computer users, surely the malicious code and data theft software or Keylogger are always mentioned .** The basic mechanism of Keylogger operation is 'hidden' activity within the Windows operating system, recording all user information manipulating the computer via the keyboard and system processes such as **Process Explorer, MSCONFIG , Autoruns .** then secretly sent these data to hackers. And of course, the consequences and damages of this are unimaginable.

Although some users have equipped themselves with security tools like LastPass when browsing the web, logging in and managing accounts, but with some other applications such as Windows **Live Messenger, Google Talk, CuteFTP, PuTTY, TrueCrypt, The Bat! .** is not sure whether it's absolutely safe or not. The idea of ?? saving all your passwords using a separate software is especially dangerous, because applications that support password recovery are mostly **Stealer** - it is possible to secretly collect the entire password. User's account, and send it to hackers without them knowing.

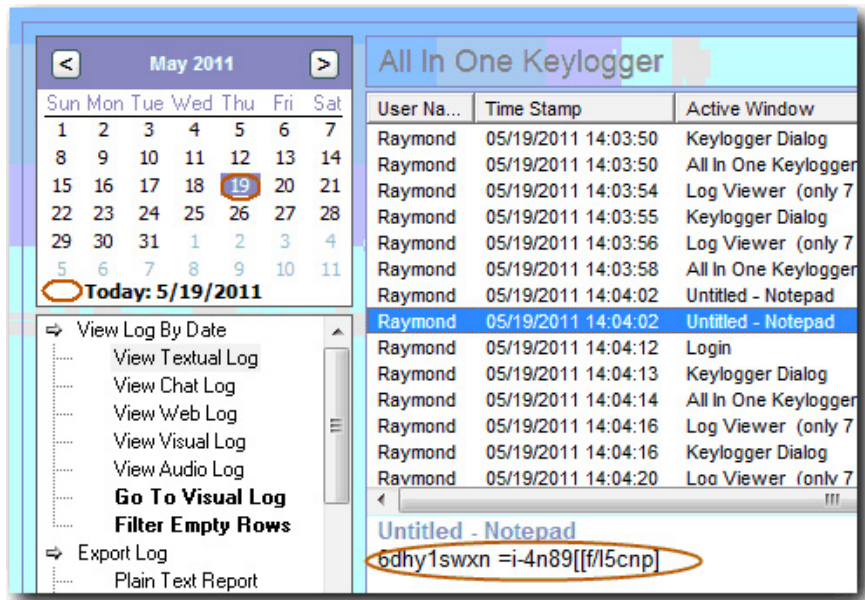

So what solution can users have now and safely? In the following article, we will introduce to you the KeyScrambler application of QFX Software - a true warrior in the battle against keylogger software is raging today. The program can encrypt all information, keystroke data in an absolute, easy way against keylogger attacks. For example, if you type in **raymond** on the keyboard, it will become **2, faf3f** - hackers will mistakenly think that **2; faf3f** is your information, not raymond. And more specifically, in the following test, the author will test the blocking ability of KeyScrambler with some 'notorious' keylogger programs and trojan Remote Administration Tool.

Currently, **KeyScrambler** has 3 main versions: **Personal - Free**, **Professional - \$ 29.99** and **Premium - \$ 44.99** . Basically, **Personal** version is just a browser plug-in, which protects the information entered from the keyboard. If you only use your computer to browse the web and chat, this program fully meets your security needs. As for **Professional** , it supports multiple browsers, email clients, IM like Windows Live Messenger, password management application like LastPass, online games like WoW and Steam . And finally **Premium** version - for those people need to apply high-level security methods like TrueCrypt, PuTTY, CuteFTP .

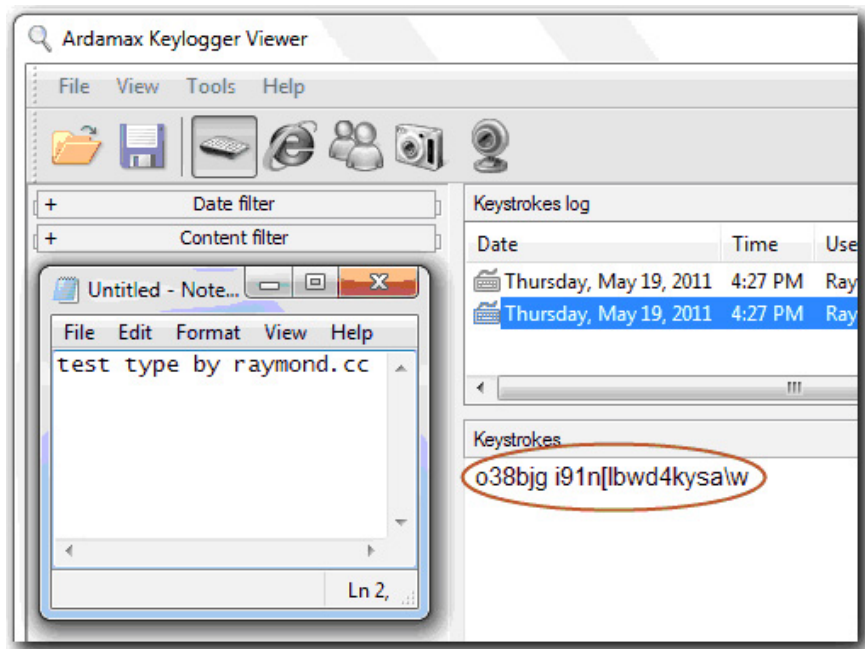

One thing to note when using **KeyScrambler Premium** is the shortcut - default is **Ctrl + Shift + K** to activate or pause protection mode, start automatically with Windows, check for updates, security Windows Logon and Windows Explorer protection, support many language formats .

**1. All In One Keylogger - ranked No.1 in the software category for Kids & Parenting in CNET magazine:**

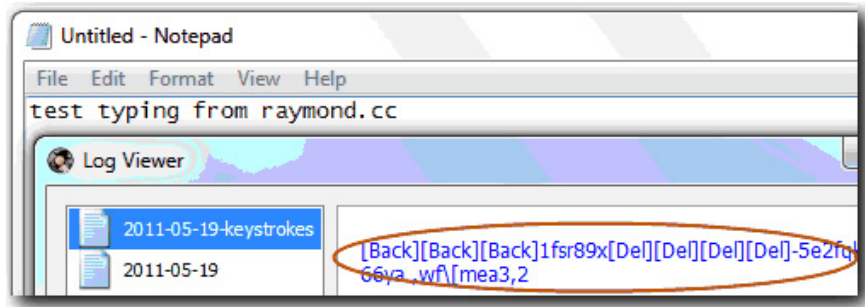

Result: successful

## 2. Ardamax Keylogger - ranked No. 2 in management software at CNET magazine:

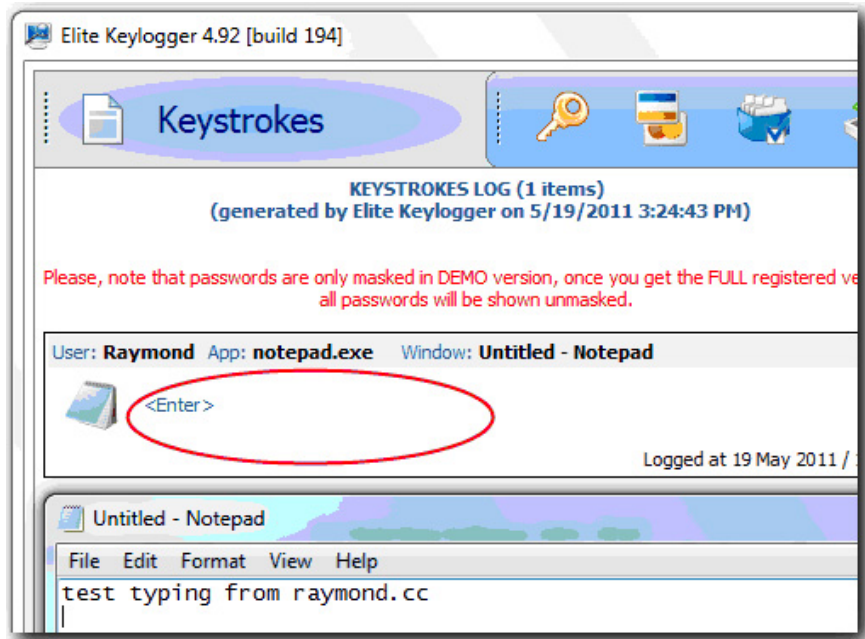

Result: successful

## 3. Award Keylogger:

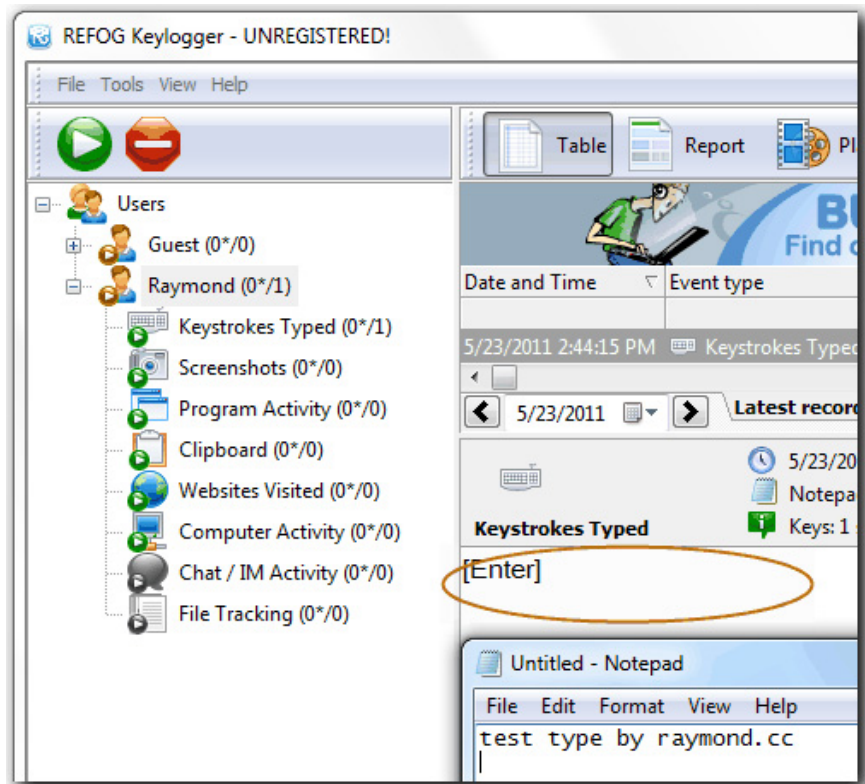

Result: successful

#### 4. Elite Keylogger:

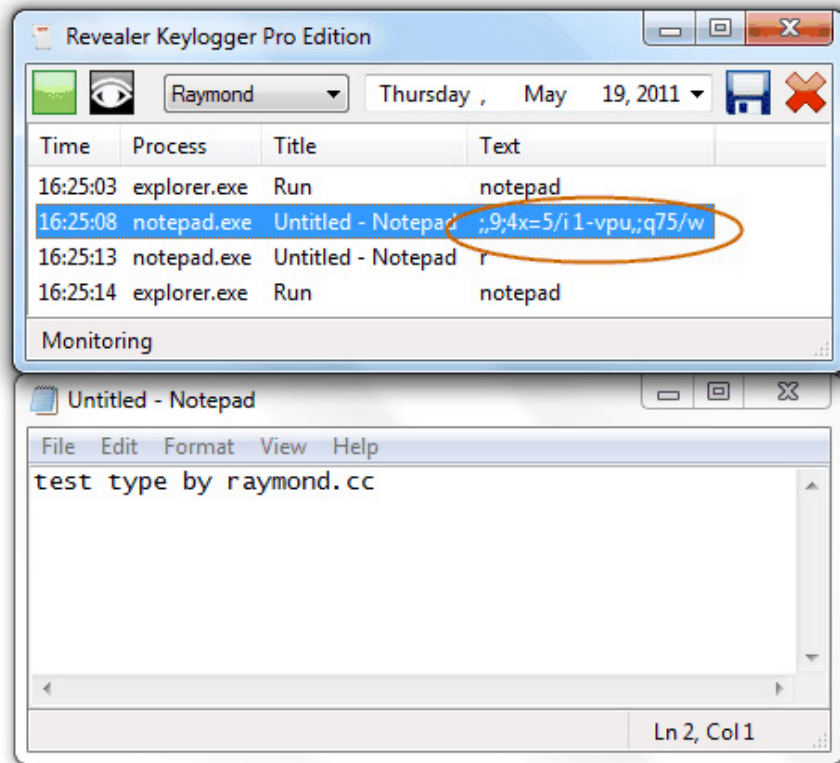

Result: successful

#### 5. Refog Keylogger - ranked 3rd in the Privacy software section in CNET magazine:

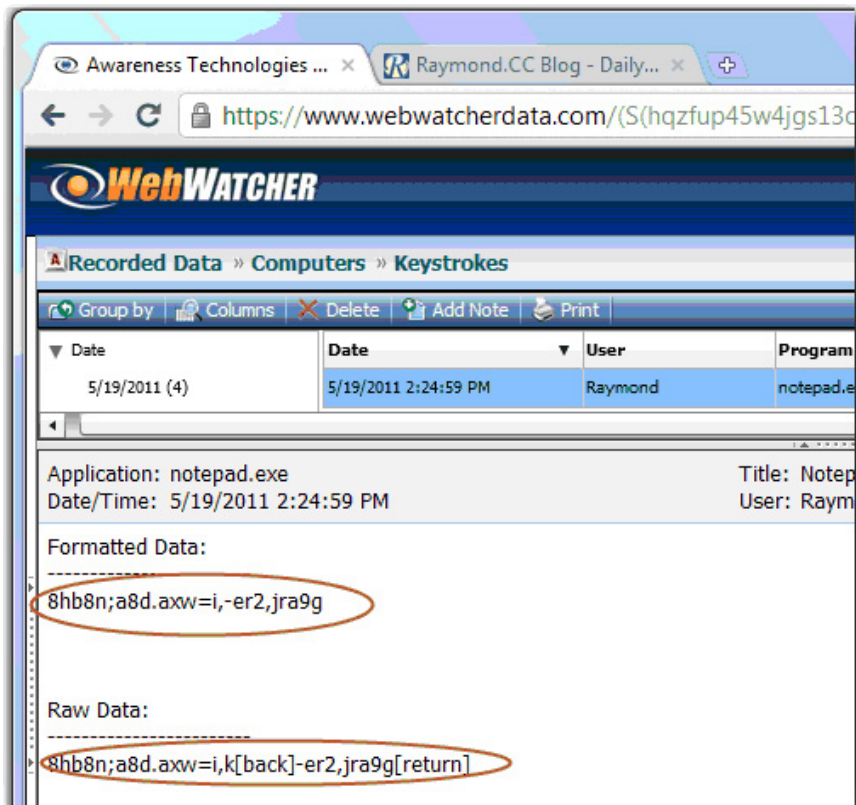

Result: successful

**6. Revealer Keylogger Pro - ranked No.1 in the software management section of CNET magazine:**

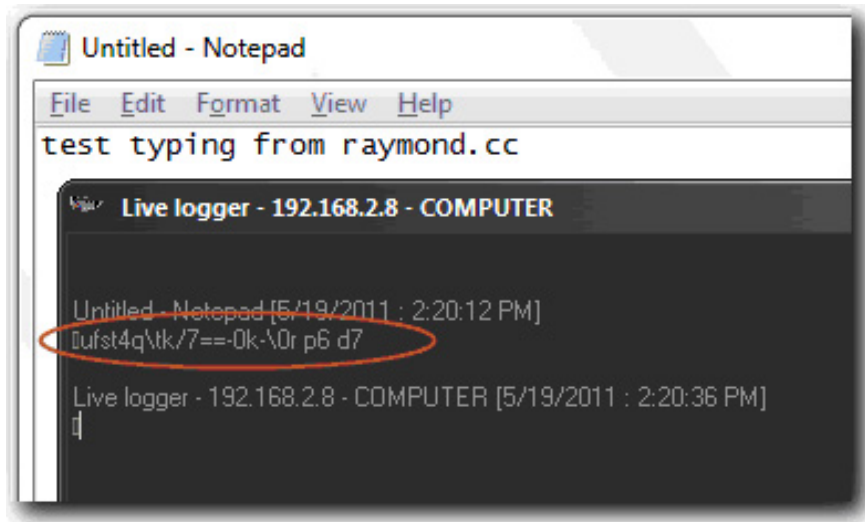

Result: successful

## 7. WebWATCHER:

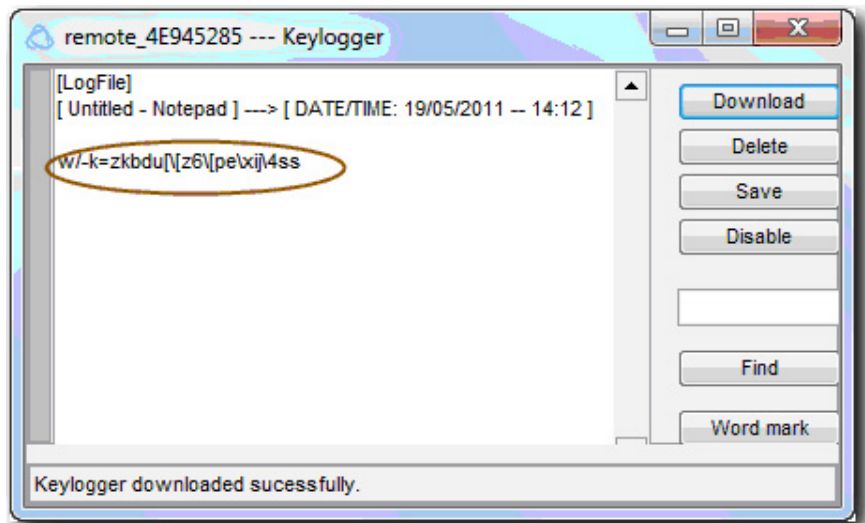

Result: successful

## 8. BlackShades SV:

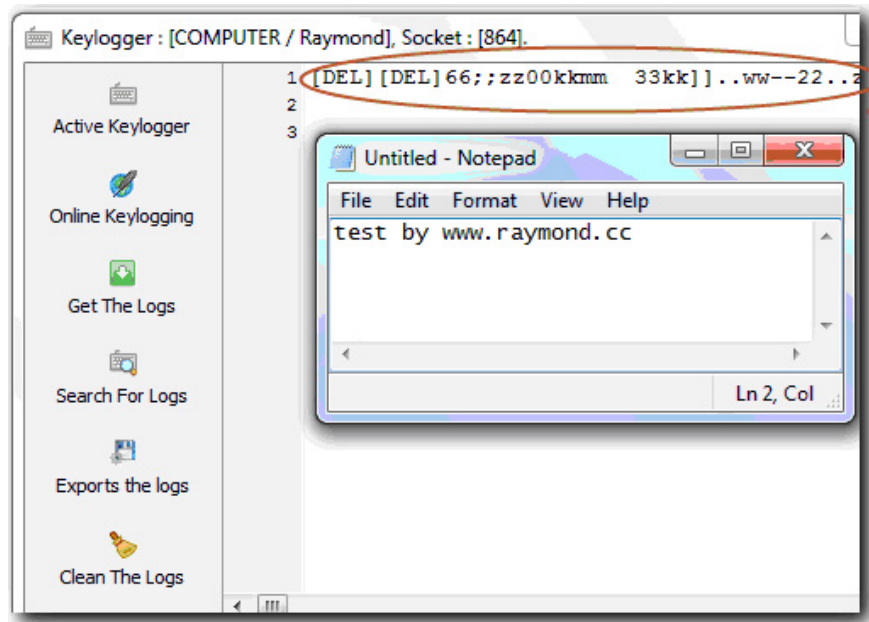

Result: successful

## 9. CyberGate SV:

Result: successful

## 10. DarkComet SV:

Result: successful

Based on the collected results, you can see that no keylogger or trojan remote administration tool can collect and steal author data from the keyboard. And with the more complete support of **KeyScrambler Premium**, users will no longer have to worry about the dangers as before. But there are still some minor points in this software, that is, with encrypted text ending in text box and not normal. When you encounter this situation, just pressing the BackSpace button once is fine. Good luck!
