

Being hit by a stray bullet, MSI's gaming screen still works normally

On March 4, 2019, a player named Eric Gan shared an unbelievable Twitter story on his Twitter account of the stray bullet but his computer gaming screen (MSI Optix G27C2). Can still work normally.

On March 4, 2019, a player named Eric Gan shared an unbelievable Twitter story on his Twitter account of the stray bullet but his computer gaming screen (MSI Optix G27C2). Can still work normally.

Gan said that around 4 am, a stranger shot a total of 5 shots into his home. Thankfully, no one was hurt. One of the bullets pierced the wall and hit the MSI Optix G27C2 screen. The amazing thing is that in addition to a slight dorsal dorsal, the screen can still operate and look normal.

Of course, before hitting the screen, the bullet lost a considerable amount of kinetic energy because it had to penetrate the wall. Certainly, the screen will fall into a terrible state without the wall.
