

Can people and robots give birth together in 100 years?

Dr. David Levy, a leading expert in the field of artificial intelligence, is based on recent advances in science when the study of artificial stem cells and chromosomes has been predicted, within 100 years. Robots can be born with children.

Dr. David Levy, a leading expert in the field of artificial intelligence, is based on recent advances in science when the study of artificial stem cells and chromosomes has been predicted, within 100 years. Robots can be born with children.

In a very special international scientific conference: International Congress on Love and Sex with Robots - The 'International Conference on Love and Robotics' was held for the third time in London, Dr. Levy made This bold prediction.

Dr. Levy said that recent studies of stem cells, bio-nanotechnology and robotic genetics are the clearest evidence of the possible combination of humans and robots in the future. He also suggested that a study by Ohio State University, scientists here developed a nanotechnology-based chip that could inject genetic code from it into her skin cells. people.

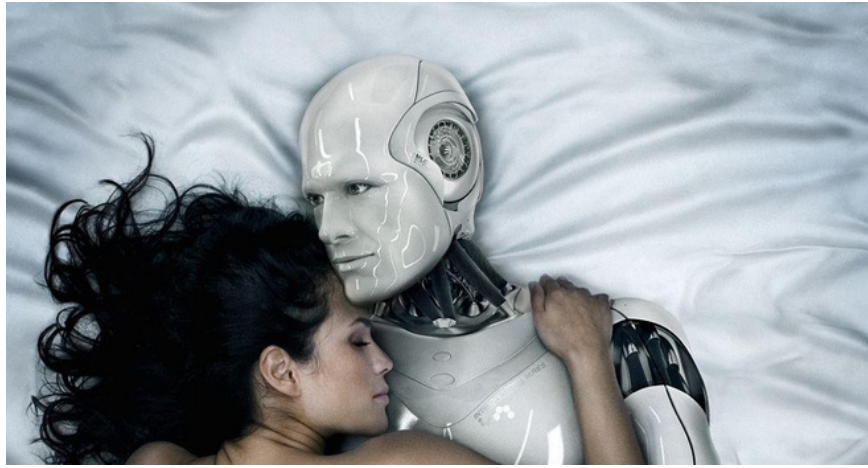

According to Dr. Levy, the genetic code of a robot can be inherited along with human genetic code to the offspring by technology called TNT (tissue nano transfection). This technology will appear in the next 100 years. Not only Dr. Levy but many other experts have crazy ideas. Sergi Santos, a sex robot inventor also predicts that

humans and robots can marry and use technology to give birth in October.

According to Santos, it is better for humans and robots to work together to create children because of the character of the robot and the characteristics of the human parent body, rather than creating robots that can born their own generation.

The child will have a new AI brain created by computer software, and their bodies will be created by 3D printing technology.

In addition, Dr. Levy predicts that humans can marry robots by 2050, even though this time may happen sooner.
