

# Cause and repair of Sanaky refrigerators cry out, not cold

Sanaky refrigerator cool? Sanaky cooling cabinets are not cold? Join us to find out the causes and how to fix these problems!

Shout loud, not cold are common problems in the line of coolers, including Sanaky refrigerators. So what is the reason why **Sanaky refrigerator is loud, not cold** ? How to fix? Read our article to get answers!

## Cause and repair of Sanaky refrigerators chirping

There are many causes of Sanaky cooling cabinets that are unusually loud, the most common of which are the following:

### **The cooler cover is loose**

When the casing is loose, the Sanaky cooler will shake during operation and cause noises or louder sounds than usual. To solve this, you need to close the case closely. In addition, during use, you should not put furniture on the top of the cabinet as this can make the cabinet louder and hinder the cooling process of the cabinet.

### **Cooler cabinet legs unbalanced**

As long as one of the legs of the refrigerator is unbalanced, it will continually collide with the floor and make a loud noise. When the deviation between the base of the cabinet and the floor is large enough, the refrigerator even shakes and you can easily see it. To overcome this situation, first, you need to check the balance of the cabinet foot against the floor, if it is skewed, you can use something to tuck in the middle or place the cupboard on another flat place. than.

### **The screws on the indoor unit are loose**

When the screws on the indoor unit become loose, the Sanaky refrigerator will make a 'podium' sound and may stop working. If this phenomenon occurs, you need to disconnect the power of the cabinet, remove the screws loose, add gaskets, then tighten again.

### **The compressor is broken**

After a long time of use, the compressor of the Sanaky supermarket refrigerator may be damaged, causing the cabinet to sound abnormally loud. If the Sanaky fridge shouts loudly because the compressor is broken, you cannot fix it at home yourself but with the help of a professional repairman.

The compressor is broken, causing the refrigerator to make a loud cry

In addition to the above, a fridge may be caused by:

1. **Structure characteristics:** Coolers with large capacity, large capacity will have vibration, emit a louder sound than refrigerators with smaller capacity and capacity.
2. **Cooling cycle characteristics:** When the set temperature is not reached, the Sanaky cooler will continue to cool. At this time, the cabinet fan motor operates and emits a 'whoosh' sound like a wind.

If you find the refrigerator chirping due to these two reasons, don't worry as the operation is still normal.

## Cause and repair Sanaky refrigerator is not cold

Sanaky refrigerators do not get cold due to one of the following reasons:

### The power supply is weak or the power connection is lost

Refrigerators are not supplied with sufficient power due to weak electricity or a loose power plug will not be able to generate cold air. First, you need to check if the power cord connecting the refrigerator and the power supply is loose or broken. If the power cord is still connected normally, it may be due to weak electricity, you should use a voltage stabilizer to stabilize the current.

### The rubber gasket at the refrigerator door was exposed

Sanaky display coolers are covered with rubber gaskets around. When this gasket is exposed, cold air from the inside of the refrigerator will escape. To check, clip a thin piece of paper to the cabinet, then pull it up and down. If the paper moves hard or gets stuck, the rubber gasket is still good, on the contrary, if the paper can move easily, the rubber gasket is broken and you should replace it.

## The refrigerator is freezing

Heavy freezing is also one of the reasons why Sanaky refrigerators are not cold. Normally, this device can automatically defrost, but for some reason it cannot defrost or defrost slowly. In this case, you need to remove electricity from the cabinet, then proceed to defrost.

## Engine is broken

A refrigerator cannot be cooled if its engine is damaged. Normally, when operating, the engine will emit small noise on the sides. If you do not hear the noise from the engine then it is likely to be broken and you should call a repairman to get support.

Call a repair person when the refrigerator motor is down
