

Chrome and Firefox can 'chat' with each other

Chrome and Firefox engineers have just developed a new HTML5 protocol, to help users of these two browsers can make video conversations with each other without having to install any more applications. Come on.

Chrome and Firefox engineers have just developed a new HTML5 protocol, to help users of these two browsers can make video conversations with each other without having to install any more applications. Come on.

According to *Cnet* on 5.2, Chrome and Firefox engineers developed the WebRTC protocol in HTML5 to make this amazing.

Chrome and Firefox users can chat with each other - *(Photos from YouTube)*

This is an open source project that allows the browser to access multimedia hardware without having to install any additional applications.

Previously, Chrome and Firefox were able to call video based on WebRTC protocol, but it could only be done when users used the same browser together, but could not chat the "left" browser as it is now.

To experience this feature, users need to use Chrome 25 beta and Firefox Nightly.

Next, in Firefox, enter the command **about: config** into the address bar, go to **media.peerconnection.enabled**, then double-click it to switch to **True**.

Details of the demonstration video and activation action can be viewed here:
