1. NASA wants to penetrate the world's dangerous dangerous volcano to prevent a massive eruption and energy gathering
2. Close up of the scene of the horrifying explosion of the super volcano, engulfing the whole city
3. Decipher the world's most dirty volcano that spits rotten mud instead of lava

The Agung volcano in Bali began operating again on November 21 after 54 years of sleep. The most recent eruption of this volcano was in 1963, killing 1,100 people, many villages were destroyed.

Concerned that the volcano could erupt strongly, Indonesian authorities have asked residents within 10km of volcanic areas to evacuate, many flights are canceled.

The volcano has begun to operate in recent months. Recently, it has sprayed more ash. From afar, one can observe the 4000m-high smoke columns and red light on the crater.
