

Close up of the process of female seahorses sending eggs by pregnant males

Seahorses are a strange creature, males are responsible for pregnancy and delivery, not females.

Seahorses are a strange creature, males are responsible for pregnancy and delivery, not females.

1. The "cunning" centipede blinks off the time when the snake is attacking
2. The rare giant 'living fossil' salamander stuck two years in the sewer line
3. Newspaper hunt racing with formula racing, who belongs to victory?

Karen Hunt, owner of a marine creature in Wiltshire, England, recorded the special mating process of seahorses in a water tank. This is a "private affair" so most people have no chance to witness it.

Two seahorses close together, and the female began to put its eggs in a special bag of males. The male seahorse will fertilize the eggs and hatch them themselves and carry them in the abdomen during pregnancy. After a few weeks of hatching eggs, the seahorse father will give birth. Seahorses can produce up to 1,500 juveniles at a time.
