

# Compare the test speed Samsung Galaxy S5 and iPhone 6

Did you know that smartphones are now better able to calculate than supercomputers used by NASA to send information to people on the Moon? Mobile devices can now give interesting numbers.

**Did you know that smartphones are now better able to calculate than supercomputers used by NASA to send information to people on the Moon? Mobile devices can now give interesting numbers.**

There are many different processors on a phone, but it doesn't always give users the perfect experience with a smartphone. As you can see, the actual implementation of a modern phone is often determined by the ability to work smoothly between software and hardware.

Apple's iPhone is a first example. Apple Company has full control over the software and hardware inside its mobile device so that both can work together smoothly. As a result, it launched a smartphone without relying on octa-core processor and *gigabyte bajillion RAM* . It is not entirely sure that speaking hardware is an advantage, especially when it comes to smartphones using the Android platform.

In fact, all phones running Android are based on the best processor available. For example, Samsung Galaxy S5 is one of the best Android devices at the moment, the device uses the fastest processor chip from Qualcomm,

2.5GHz, quad-core Snapdragon 801. But in the end it is a better solution. ? Is Samsung S5 or iPhone 6 faster?

To answer these questions, the *phonearena* page has made a Video for comparison between these two devices. The video compares the speed of Samsung Galaxy S5 and iPhone 6 - a comparison to determine which phone is more powerful in practice. Both devices are good, the iPhone 6 performs well on the basics and its core applications while the Samsung Galaxy S5 highlights some points in other areas. Please take a look at the video comparing the speed of the two devices:
