

'Death', Tesla's super weapon can wipe out the army from hundreds of kilometers

The weapon of the gods can wipe out 10,000 aircraft and one million troops at a distance of hundreds of kilometers.

Weapons of weapons can wipe out 10,000 planes and one million troops at a distance of hundreds of kilometers, the destructive weapons we often see in terribly destructive sci-fi movies. This is also a weapon that every country wants to own but so far has not been successful.

1. Russia successfully built a quantum engine, speed of 1,000 km / sec
2. Russia owns a new rocket that is 6 times faster

Historically, the closest person to the complete model of death was scientist **Nikola Tesla**, a great inventor. His inventions were always ahead of his time, and the most famous was the wireless radio network (WiFi) system in the 1920s that helped change our world.

Nikola Tesla (1856 - 1943), the scientist "crazy" talent of the century.

In the late 1930s, Tesla realized that the "war ghost" was invading many parts of the world, especially Europe, so he tried to invent a super weapon named **Teleforce**, which according to him will prevent all wars in the world. That super weapon emits death rays that can destroy 10,000 aircraft and a million infantry soldiers from hundreds of kilometers away.

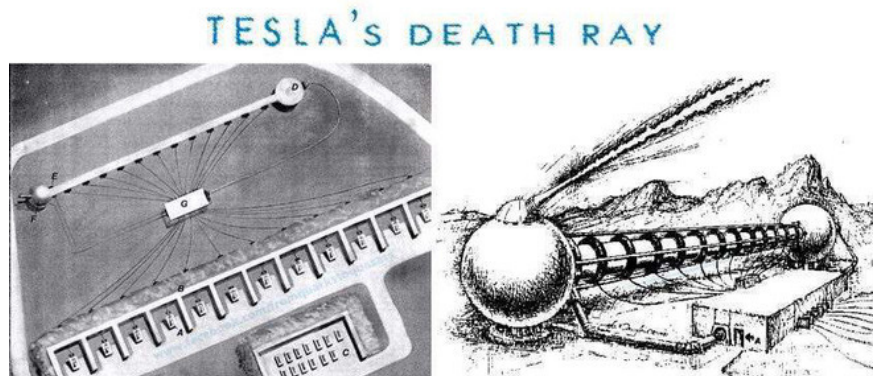

This super weapon is a type of gun that can emit death beams that carry tremendous energy. Its structure consists of 4 parts:

1. Equipment to create electromagnetic beams in the air.
2. Large capacity generator.
3. Energy amplifier.
4. Powerful pulse generator.

Teleforce was designed to be installed in strategic locations along the border and the coast, with smaller variants equipped with battleships.

Tesla's electromagnetic **beam** is a **bunch of tiny tungsten particles that** are ejected by electromagnetic force, which helps the beam focus for long periods of time. This beam can be shot with a telescope, and in theory it can destroy everything in sight.

Tesla's "spirit" can cause the target to disappear without trace, thus securing a secret.

Tesla's invention model.

According to Tesla's plan, 200 death beams will be placed along the US border and coast, creating a solid defensive shield, which can melt the thickest armored vehicles, turn engines into scrap metal or erase all weapons of potential enemies.

However, his plan could not come true, it was considered too ambitious at that time. The US government thinks it is an unproven idea and lacks practicality. Tesla was denied funding by countries to implement a project of death rays.

Tesla is a peace lover, his purpose of creating super weapons is to prevent war from happening but it seems that he forgot an important detail, that is, even if a weapon can be wiped out humanity, people still launched wars.

Tesla died in 1943, and the Teleforce super weapon was still an idea on paper and never became a reality.

Thanks to Tesla's electromagnetic particle beam, military scientists have the opportunity to invent and discover the power of **lasers**, although current inventions do not have the tremendous power as Tesla describes. .
