

Dehumidifier - an effective weapon against humid weather in Vietnam

With a humid atmosphere, choosing to buy a dehumidifier will help your home more open and limit some skin or respiratory diseases. In this article, you will have the necessary knowledge to choose to buy dehumidifiers and use them effectively.

Nobody likes the humid weather when it greatly affects your daily life. Not only the drizzle but also the humidity of the air increases, making everything wet even "sweating" on the wall or floor. More dangerous, many respiratory diseases are also susceptible to this type of weather.

Many families calculate to choose a dehumidifier, but not everyone has useful information to choose the right type. The following article will give you some knowledge about choosing to buy dehumidifiers.

1. Prevent diseases with humid weather during the Prevention Tips when the weather is low .

1. Use air conditioner instead of dehumidifier:

The price of dehumidifier on the market today mostly fluctuates at 3.5 to 10 million dong. Time to use the device is not too long, only a few months of the year, making many people hesitated when buying. Many families choose to use air conditioners instead of dehumidifiers, when turning on dry mode to reduce humidity in the room. However, do you try to ask the question of whether to use an air conditioner instead of a dehumidifier?

According to How Stuff Works, the air conditioner has the same function as a dehumidifier, sucking warm air and bringing air through a cold coil. But the big difference is, the air conditioner does not heat the air before being discharged, there is no hygrometer to measure the relative humidity. When cooling the house to the set temperature, it will stop running, causing humidity to increase again even if the room temperature rises. Not to mention, larger air conditioning capacity consumes more electricity.

The dehumidifier is the opposite when it promotes strong dehumidification, the mobility is more flexible when we need to dehumidify at the corner, stairs, or in the room. So, you might consider buying a dehumidifier for your home.

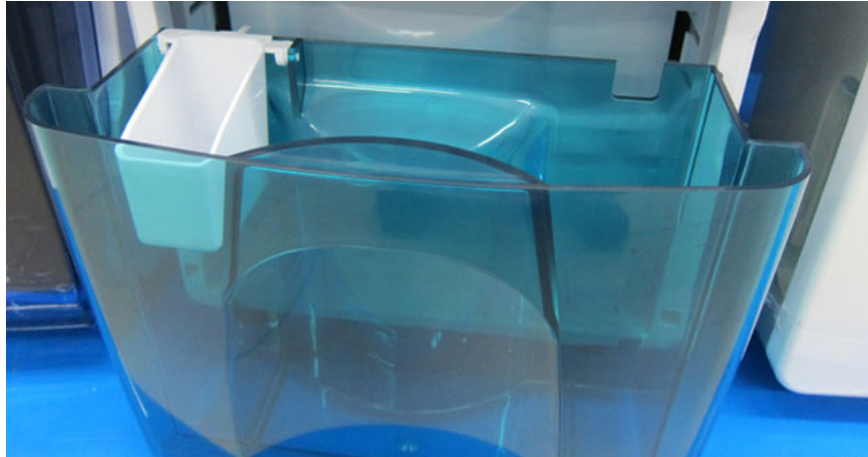

2. Effect of dehumidifier:

Most dehumidifiers are divided into 4 **main parts** :

1. **Fan Compressor** : Device that compresses and spreads a cool air like freon to cool the dehumidifier coil.
2. **Reheater** : Collect and keep the heat generated from the cooling process.
3. **Compressor cooling coils** : **Compressor cooling coil**

4. **Reservoir** : Water tank.

The fan will collect moist air from the surrounding area and suck them into the machine. The inward air will be exposed to the cooling coil of the dehumidifier. These coils will use condensation to separate moisture from the air. Moisture will be deposited and flow into the container of the dehumidifier. In that gas, the machine will heat the air (which has been slightly dampened) and brought back into the room.

Dehumidifier will have a removable water tank, convenient for cleaning as well as water treatment in the container. Most dehumidifiers have automatic shut-off features when the water in the tank is full, so you don't have to worry about water spilling out. Some types of dehumidifiers are equipped with a thermometer, which determines the humidity as desired. For example, if we choose 50% humidity, the machine will work and maintain this moisture in the room.

3. **How to buy a dehumidifier:**

On the market today there are two types of dehumidifiers, **mechanical controls** and **electronic machines** .

Electronic devices often have a higher price, greater hygroscopic performance, more features such as increased fan speed reduction, air drying mode for faster drying, air purification, timer mode, . **If the room is 30m² or more** , it is recommended to choose an electronic device to achieve the maximum hygroscopic performance. **The most common desiccant efficiency level is 12l / day, 16l / day and 20l / day** and at this level, it is recommended to choose mechanical control machine which will be cheaper.

Dehumidifier controls muscles

You can choose to buy at many electronics supermarkets or through online sales websites such as META.vn to choose a variety of genuine genuine dehumidifiers, the price is usually reduced by about 200-300 thousand dongs. quantity still guaranteed.

At META.vn online supermarket, there are always many models and items of dehumidifiers for you to choose, with prices ranging from 4 million to 15 million or more, depending on capacity and categories for you. options - household and industrial dehumidifiers.

4. How to use an efficient dehumidifier:

In durability, in people, when you know how to properly use and preserve the dehumidifier, it will maximize its effect and prolong the life of the machine.

Dehumidifiers are usually capable of absorbing about **10 - 12 liters / day**, usually have a capacity of **210 - 250W**, samples with higher capacity reach **400 - 600W**, certainly consume less power than air conditioner. Follow the tips on How Stuff Works to save electricity bills, don't turn on the machine all day, set the hygrometer to a reasonable level at 50%. When using it, it is necessary to close the door to increase the efficiency, as well as to prevent it from working continuously at high intensity.

The air exhaust unit is located on the top of the machine, but if the type of exhaust door is located at the back, we need to place the machine away from the wall and furniture so that the air is more freely circulated. In particular, keep the device away from dust sources to limit machine congestion. Regularly check and clean the filter, prevent dust from clinging to it, which will affect the dehumidification effect.

Pay attention to cleaning the filter regularly
