

Delete Collection in MongoDB

The `db.collection.drop ()` method in MongoDB is used to delete a Collection from the database.

Drop () method in MongoDB

The **`db.collection.drop ()`** method in MongoDB is used to delete a Collection from the database.

Syntax

The basic syntax of the `drop ()` command is as follows:

```
db . COLLECTION_NAME . drop ()
```

For example

First, you check the available Collections within the **mydb** database.

```
> use mydb switched to db mydb > show collections mycol mycollection system .
```

Now, delete the Collection as **mycollection** as follows:

```
> db . mycollection . drop () true >
```

Then, check the Collection again inside the database:

```
> show collections mycol system . indexes tutorialspoint >
```

The `drop ()` method will return `true`, if the selected Collection is successfully deleted, otherwise, it will return `false`.
