

## Discover Google+ for Android

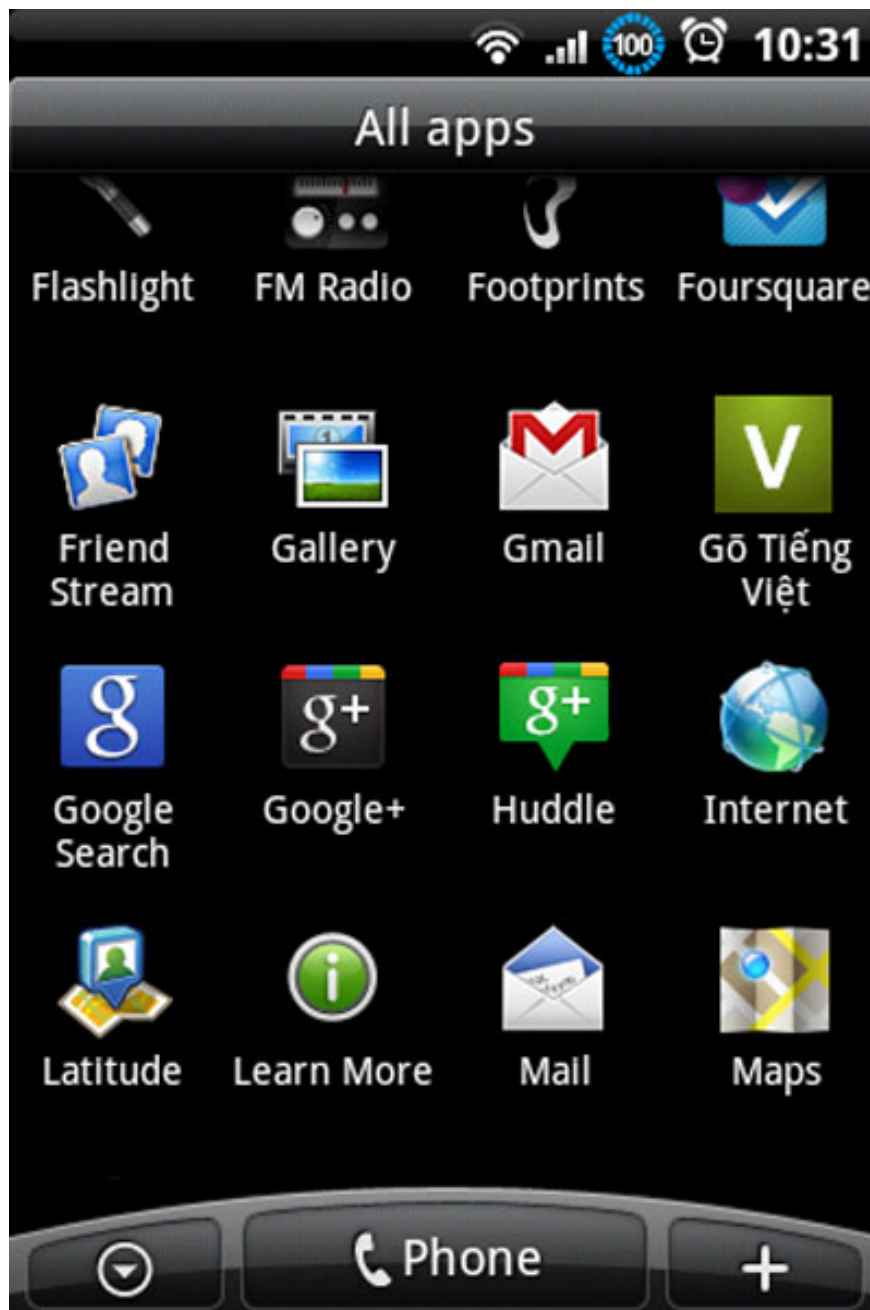

The new social network that is causing 'fever' of Google has software running on Android mobile. Other models such as iOS, BlackBerry, Windows Phone can only be accessed via the mobile website address [m.google.com/plus](http://m.google.com/plus).

**New social network is causing "fever" of Google has software running on Android mobile.**

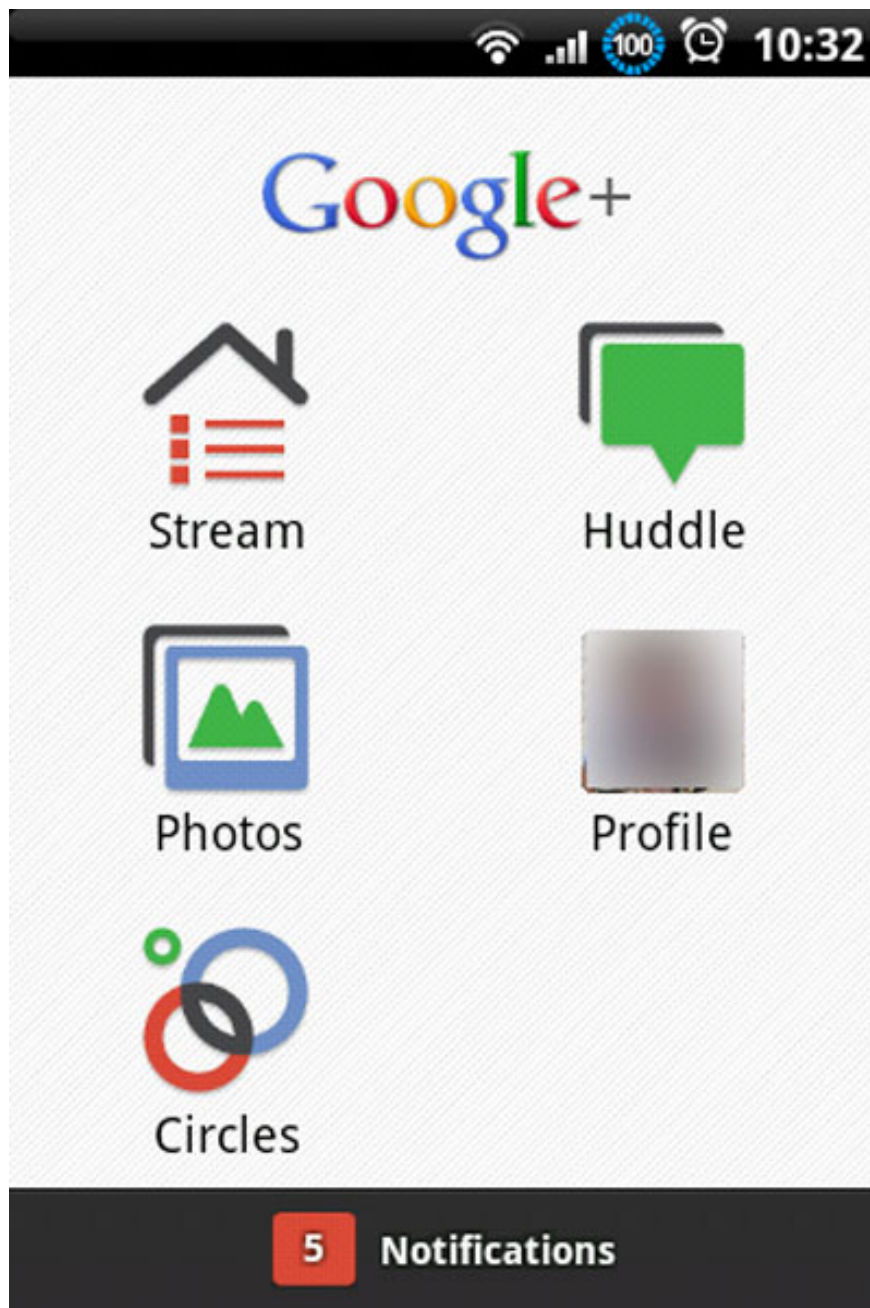

Google's new social network bears the name Google+, which is causing fever for young people, but is currently in beta. The software for this social network is currently only available on mobile phones running the Android operating system. Other models such as iOS, BlackBerry, Windows Phone can only be accessed via the mobile website address [m.google.com/plus](http://m.google.com/plus).

Only users in the US can download this application through the Android Market. However, those who want to test this software can download it [here](#) , then copy this .apk file to the memory card and install it.

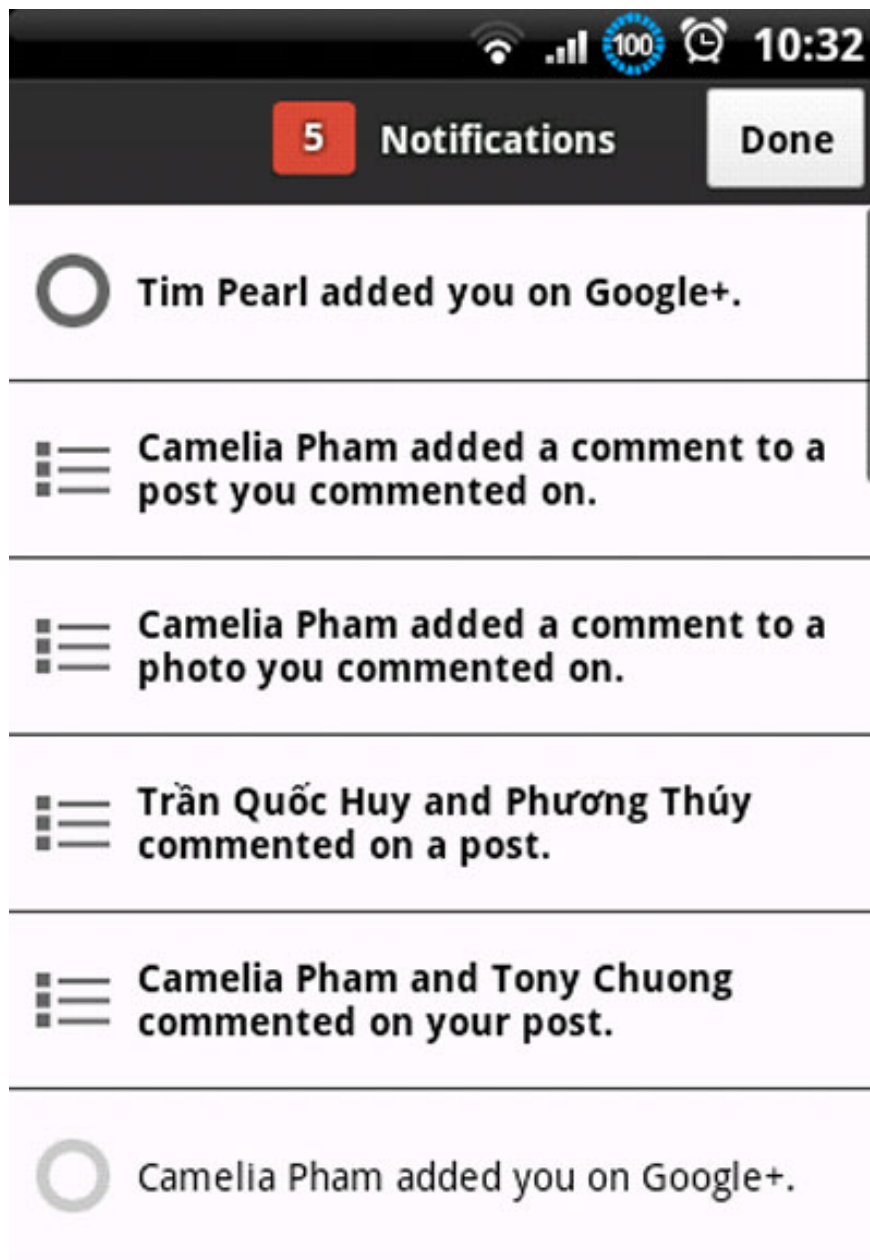

**Here are some photos of the Google+ app for Android devices:**

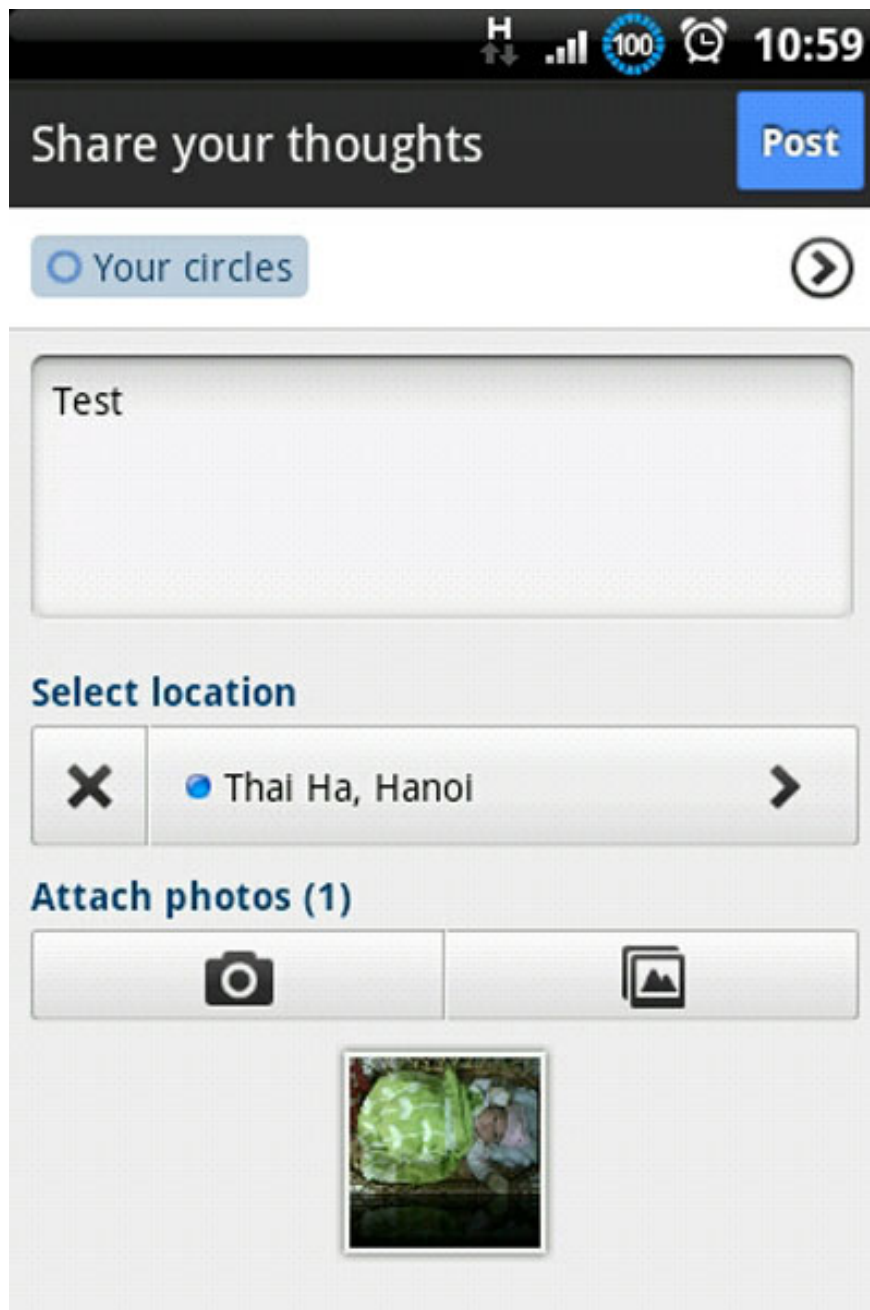

The new Google+ application is only for download for users in countries like the US. In Vietnam, if the user wants to have this application, there must be an external installation file, copied to the memory card and installed. When installed, Google+ will create two shortcuts, Google+ and Huddle (messaging application via Google).

Google+ home interface with quick menus and notification bar below. The Stream section is to update news from friends (like News Feed of Facebook), Huddle is a messaging application with friends via Google+ account (or Gmail if not yet with Google+). Circles are like Friends on Facebook to see friends list but more visually divided.

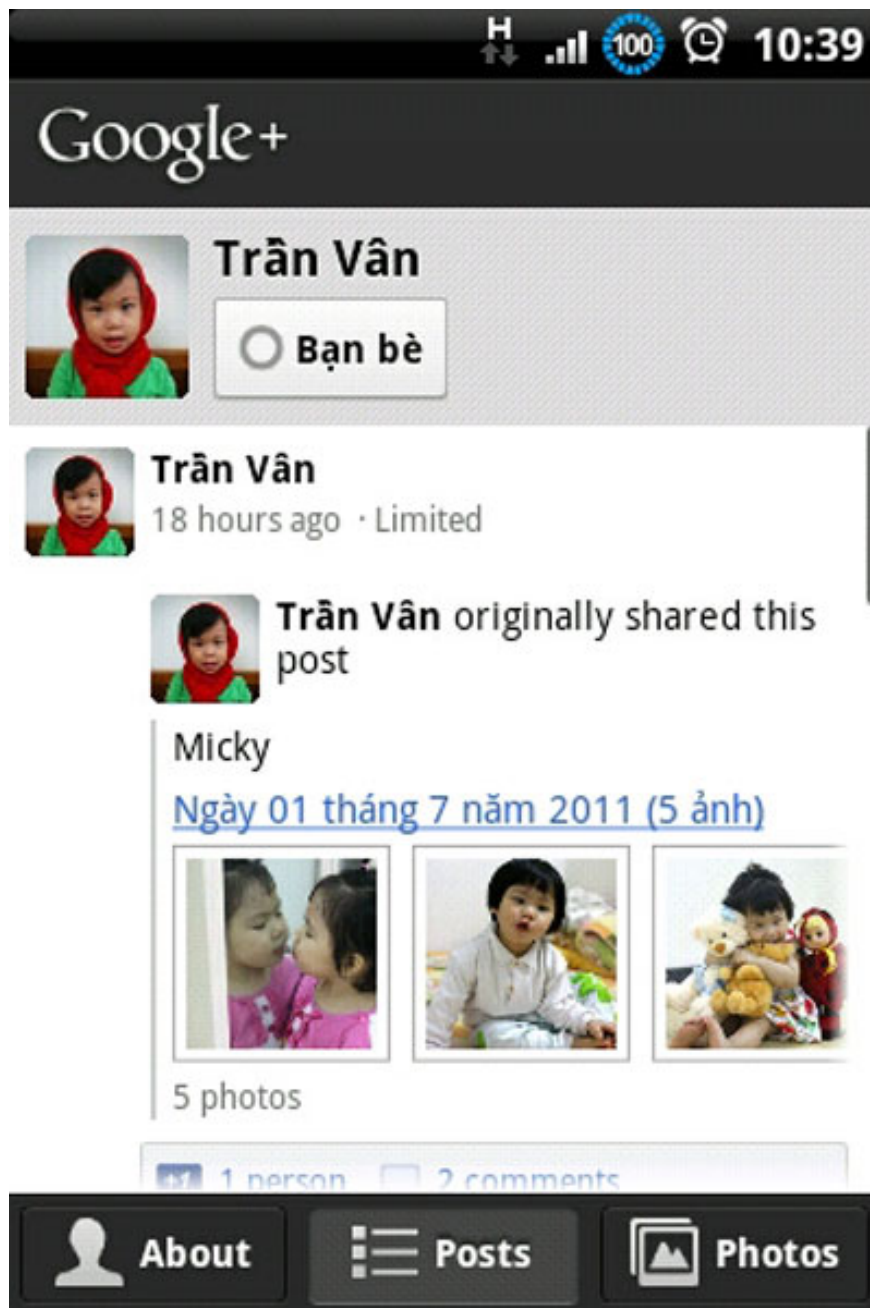

To see notifications, users also pull up the same as Facebook apps. Click on each notification to see a specific post.

Updating status on Google+ is very interesting with a full set of location notifications, creating more photos and choosing the group you want to share.

When accessing the Circles section, users can choose their groups of friends to follow. Like Friends on Facebook, but grouping is more intelligent and intuitive.

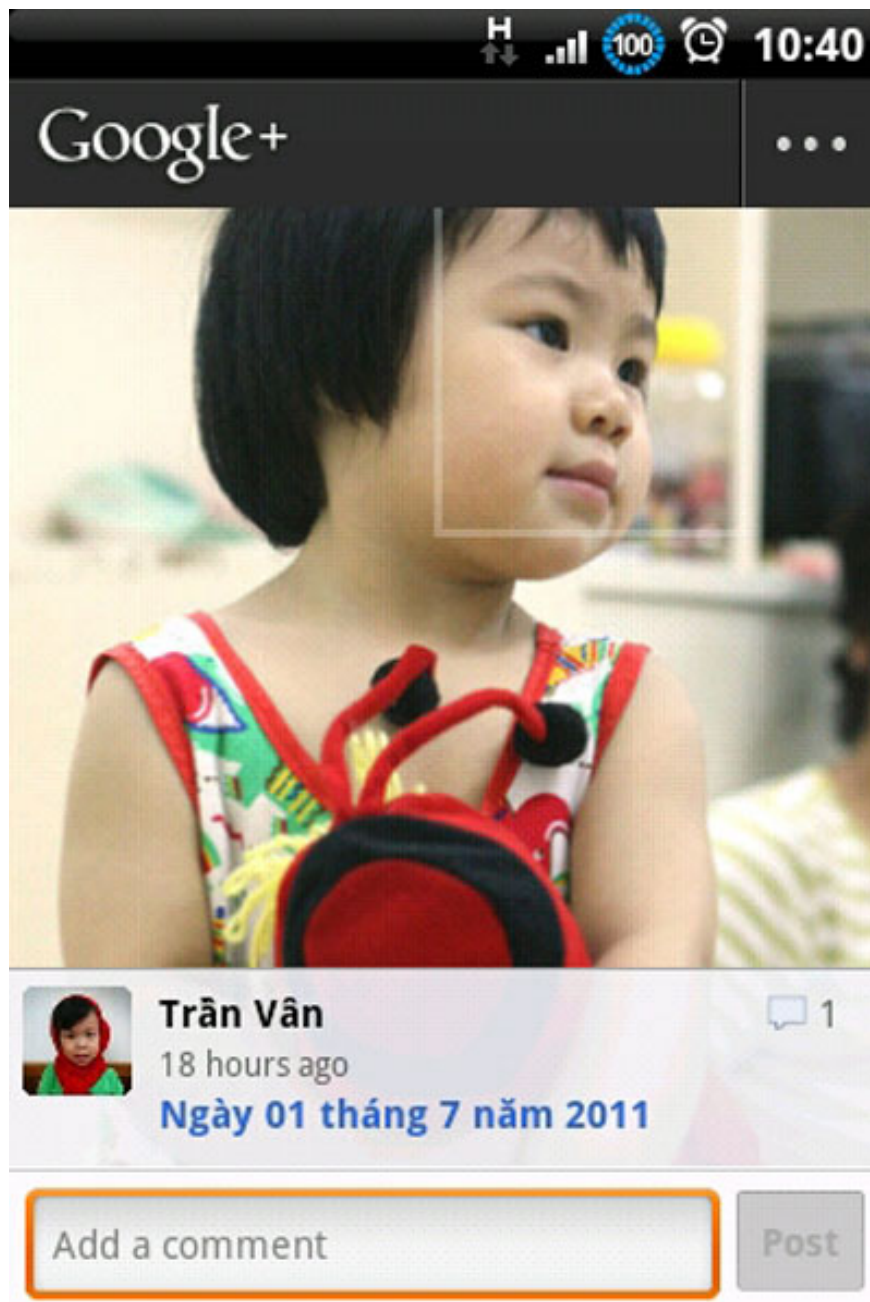

Interface view section of friends. Full display information includes Info, Post and Photos. Users can also change the connection right here by clicking on the section below the name of the friend (as shown in the picture is Friends).

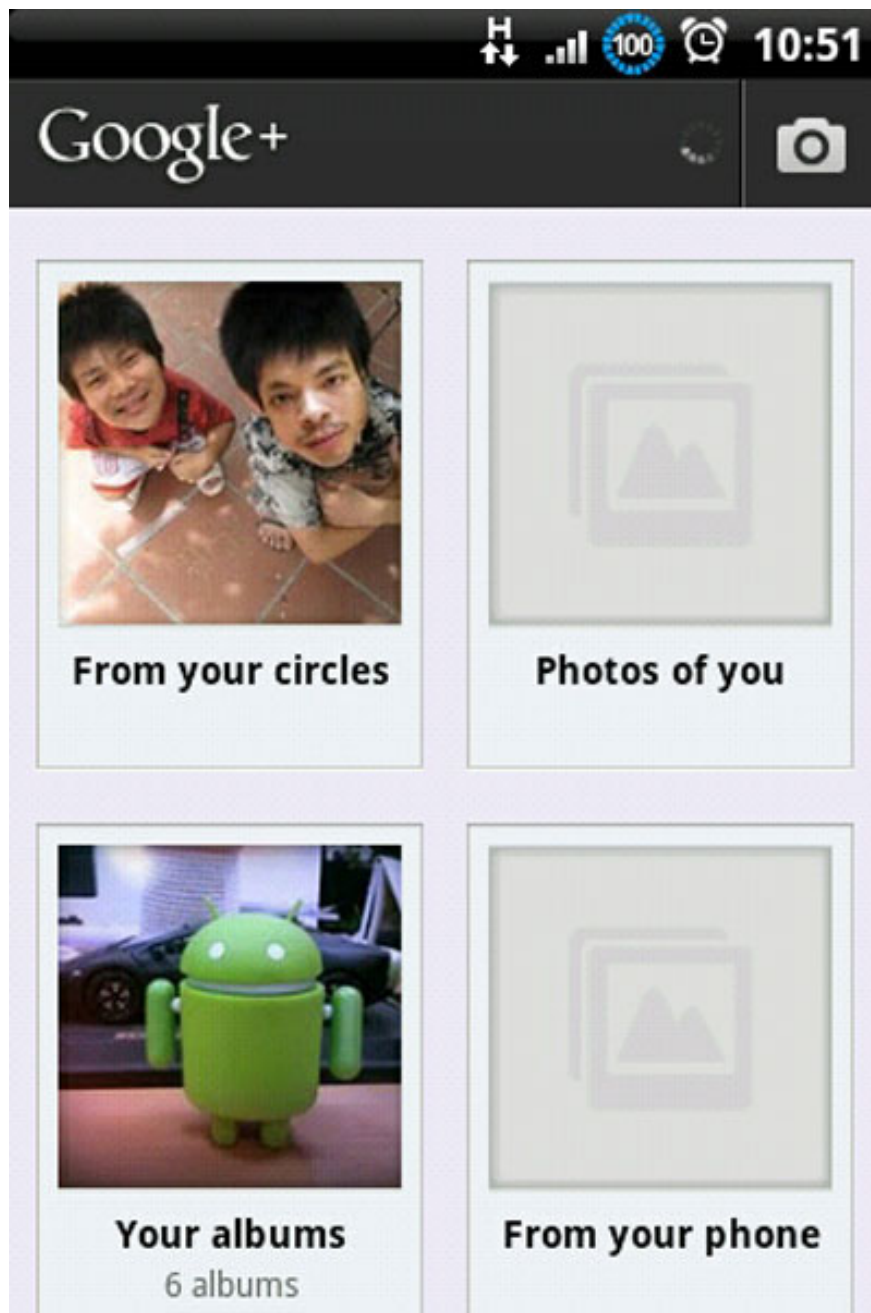

The Stream page interface is quite interesting, showing detailed information, the camera button allows downloading images directly from the camera or capturing and uploading instantly. The pencil part is for creating a personal status post. The left icon of Camera is quite similar to Foursquare, which helps find nearby places and "check-in" there.

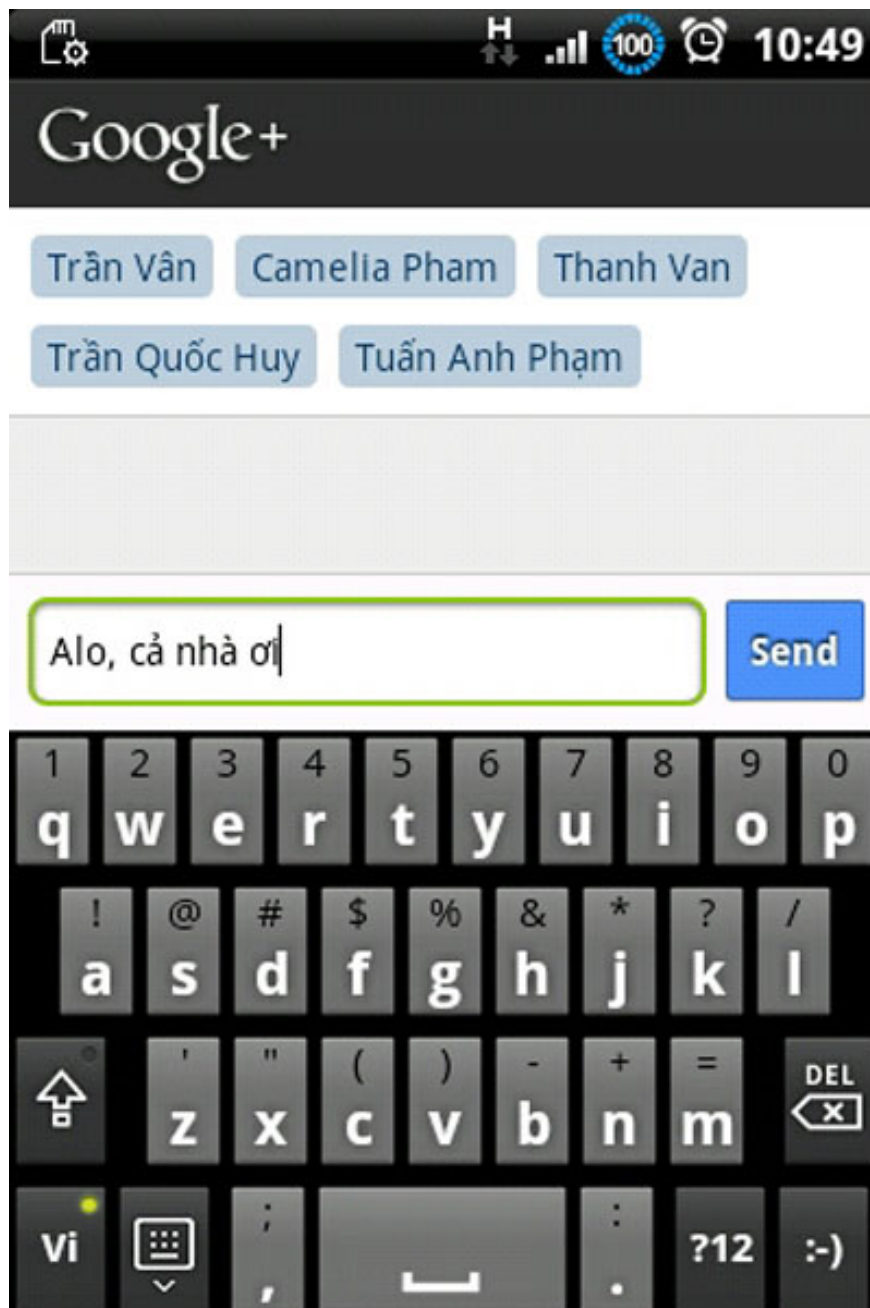

+1 of Google+ is similar to Facebook Likes, the +1 button is above the post and the comment tag is right in the software by pressing @ and then the name of the person who needs the tag.

See photos in Google+, Google's social network outperforms Facebook in terms of the quality of images uploaded through Picasa services. However, it is currently not possible to tag photos on this application.

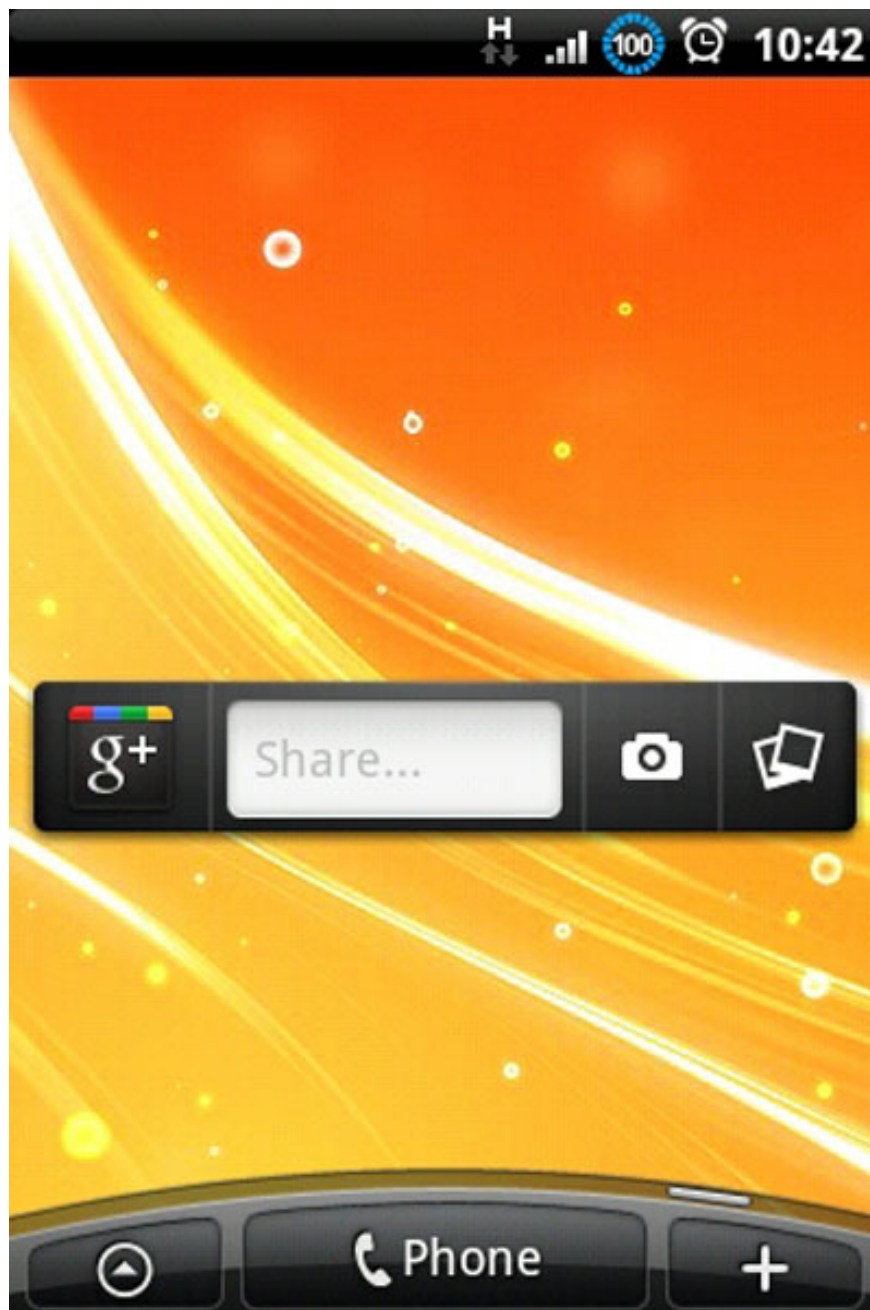

Photos section to see photo updates from friends, from your phone, photos with yourself and your own photo albums.

The Huddle section is very interesting (users can access directly with the Huddle icon outside), this feature is similar to Gtalk chat with friends with Google+ addresses or only Gmail. This application can chat in groups very well by adding many people.

With two users using the same Google+ settings, it is easy to send messages back and forth without having to spend the sms cost of the network (only costing 3G, Edge connection).

Widge for Google+ on the outside of the screen allows sharing status, images or viewing photos directly.
