

Discover mysterious monster fossils in Siberia diamond mine

The diamond mining workers at the Siberia mine were aghast when suddenly found a strange monster fossil and foreign archaeologists also embarked on it.

The diamond mining workers at the Siberia mine were aghast when suddenly found a **strange monster fossil** and **foreign** archaeologists also embarked on it.

Mining workers at the diamond mine in Siberia reported finding a strange fossil right at the sand at the mine.

The photograph shows that this is a very fossil-like fossil of a **demon** or beast that appears in legend. Archaeologists said that this demon creature can appear at the same time as **the dinosaurs** , it has large fangs and huge jaws and while alive, this beast's jaw works very hard and forcefully when eating meat . Some other archaeologists said that this could be the body of a strange ancient creature named **Sable** , or it could be a **Mactet weasel** , a weasel, the oldest in the family of weasels.

Beasts are found in Siberia diamond mines, possibly an ancient weasel of weasel family.(Image source: Siberian Times.)

Overall, the strange creature consists of a long, complete, slender skull, a full neck, curved back, two front limbs, two limbs, each with claws however, the latter two seem to evolve. stronger and more developed than the two front limbs of bone structure, size, and fingers . The brain and body hair are well preserved, so everything is almost intact.

Archaeological experts have suggested that this creature could exist during the Mesozoic era (including the Triassic, Jurassic, and Cretaceous period) about 66 million to 252 million years ago, this is the period of fighting. There are many diverse species of animals, plants, and prehistoric creatures that have been extinct after the destruction.

Currently, archaeological experts are continuing to take samples to conduct research on fossils of this beast creature.
