

Discovered the 2800-year-old ancient seed found in Turkey

Many ancient seeds of 2800-year-old wheat and sesame seeds found in Turkey are intriguing archaeologists.

Many ancient seeds of 2800-year-old wheat and sesame seeds found in Turkey are intriguing archaeologists.

Accordingly, the incident was discovered during an excavation at **Cavustepe Castle** in Van Province, Eastern Turkey, found by a group of archaeologists from Van Yuzuncu University Yil.

' There are three ancient cereal warehouses found during excavations, inside contain a lot of wheat, ancient sesame is preserved in ancient ceramic boxes called pithos boxes, ' said archaeologist Cavusoglu in a statement.

Archaeologists now continue to bring these ancient seeds back to the laboratory and will **revive** them through **carbon cells** , hoping to make new progress if the seeds revive.

If these seeds were roasted by fire by the ancient people before being stored in a ceramic box, it would be difficult to revive them.

Moreover, the 2800-year-old ancient seed was found at Cavustepe Castle in the 8th century BC built by the second King Sarduri. What is special is that this castle is located on the route of commercial traffic through Northwest Iran. Therefore, these seeds may be important evidences reflecting a local cultural circulation of the

ancient people in the 8th century.
