

Distinguishing the Most Popular Types of Headphones Today

Headphones are an indispensable part of life. How to choose the right headphone? Hoang Ha PC shares with you how to distinguish between types of headphones.

Headphones (full size)

Nowadays, you will have many types of **headphones** with diverse designs and colors. The way to distinguish these popular types of headphones is to look at their external design.

The top quality ranking in the headphone types must include the over-the-head headphones or also known as full-size headphones.

With a rather bulky exterior design, the sound quality and sound insulation are extremely good. When using this headset, you will feel all the melodies inside without fear of interruption or interference from the outside. But note that you should avoid wearing this headset for a long time as it can lead to ear and head pain. Because of the good sound insulation quality, the price of this product is relatively high, and is often used mainly for.

Earpad Headphones

Earpad headphones are traditional headphones with an external design similar to **full-size** headphones . However, **Earpad headphones** are designed to be more compact and lighter, only covering the ear rim. With this compact design, users are less likely to feel uncomfortable when wearing headphones for long periods of time. In addition, the sound quality of this product is also excellent.

Currently, to meet the needs of users, this headset is produced in many different colors and designs. The price of the product is also cheaper than the over-the-head headset, but the soundproofing quality of the **Earpad** headset is not as good.

Type of Compact Headphones (earbuds)

Do you know how to distinguish between these **popular types of earbuds** ? Let us show you how.

Earbuds are the most commonly used headphones today. With a compact design, you can use them when traveling on the bus, walking or in any environment. Diverse in color and design, the product price is also quite cheap, only from a few dozen to a few hundred, you can own this headset.

Although the price is relatively cheaper than other products, earbuds still produce good sound quality and sound insulation. One disadvantage of this product is that the wires are often tangled, to overcome this situation you can buy a box or a headphone bag.

The manufacturer also launched Earpods headphones to serve Apple fans. In-ear headphones

A commonly used type of headphones is the in-ear headphone. The product is designed to be quite beautiful and relatively compact, and can be easily used. It can be said that the soundproofing quality of this product is absolute, when wearing in-ear headphones, you are completely isolated from the outside sound. Depending on the price segment, the product quality will be different, just a few hundred you can own this headphone. The product has the disadvantage that the wire is easily tangled and the headphone cushions are easy to fall out.

Clip-on Headphones

Distinguishing between popular types of headphones has never been easy, with similar sizes and designs that can easily confuse users. Below will show you how to distinguish between clip-on headphones.

Clip-on headphones are a special combination of earbuds and earpad headphones. With separate headphones and no connecting bar, they are instead connected directly to each side by a wire. This design will help reduce the weight of the headphones significantly, causing less discomfort to the wearer. However, that is also a disadvantage of the product because it is easy to let in noise when listening. The price of the product is also relatively high, but in return the sound quality is good.

Behind the neck Headphones

The last product in the way to distinguish popular types of headphones we want to introduce is the behind-the-neck headphones. The type of headphones is often seen in gyms or sports centers. With a compact design, there is a fixed support bar behind to keep the headphones more secure. The sound quality and sound insulation of the

product are impeccable, so the price is also relatively high.
