

Do not worry about 'evaporate money' when using air conditioner

Air conditioner is one of the appliances that need to use a lot of electric energy in the family, especially in the long summer months, which increases the usage time of air conditioner. So how can save electricity but still can ensure family activities for hot summer days?

Air conditioner is one of the items that need to use a lot of electric energy in the family, especially in the long summer months, which increases the usage time of air conditioner. So how can save electricity but still can ensure family activities for hot summer days?

In this article, we will tell you ways to save electricity, limit the loss of money too quickly when using things and still ensure a pleasant atmosphere for family members.

1. How to choose the appropriate air conditioner capacity
2. How to choose air conditioners for homes with young children

1. Off timer at night:

At night time, we will not require a cool temperature compared to the day. If you keep the air conditioner operating continuously, it will have a significant impact on your health, especially young children can lead to sore throat, . Therefore, using the timer will help protect the health of each. Family members, at the same time the operating time of the air conditioner will be less, save more power.

2. Select appropriate power conditioner:

If drawing with a strong capacity will consume electricity, or run with a weak capacity, the operation will not be effective, does not guarantee the coolness for the room. So before installing air conditioner for the room, you need to calculate how much area or room volume, so that you can choose the right air conditioner capacity.

If room size is under 15m², choose air conditioner 1 HP, from 15 to 20m², choose 1.5 HP air conditioner, under 30m² choose 2 HP air conditioner, and 30 to 40 m² choose 2.5 HP air conditioner. If your family is planning to buy air conditioner for your child's room, it is necessary to carefully calculate so as not to affect your baby's health and still help him to sleep well on hot and uncomfortable days.

3. Notice the appropriate air conditioning installation location:

Selecting the position of the air conditioner will also affect the working capacity of the machine. If placed in a hot position, the air conditioner must be more active and consume more power. Therefore, we should install the machine in cool, shaded locations, limiting the sunlight from the east or north of the house.

4. Turn off air conditioner properly:

Usually people still only use the power button on the controller to turn off the air conditioner. However, the device will continue to consume a certain amount of power without your knowledge. To limit this power

consumption, you should disconnect the Aptomat after turning off with the control.

5. Periodic conditioning maintenance:

Regular cleaning not only cleans the air but also helps the machine work better and healthier. If possible, you should clean and replace the filter every 2 months, cooling coil once a year, contact the maintenance staff every 6 months.

6. Restrict to operate the device 24/24:

If there is no need to use or when the house is cool, turn off the device. We can also use replacement fans while regulating rest, limiting the work overload.

7. Limit on / off multiple times:

Turning on or off continuously will be counterproductive in saving electricity. When you turn off, the conditioner needs a lot of energy to restart. Therefore, in order to save energy effectively, we should keep the room temperature at a stable level and limit the turn off and turn off too many times.

8. Reasonable temperature:

With the weather like in Vietnam, the relevance will be 25-27 degrees. When the machine works at this level, the working intensity of the machine will decrease, saving more power.

Above, we have shared with you some useful experiences when using air conditioning and saving money for your family.

9. Cool the room with the fan in the first minute:

In summer, when you want to use the air conditioner, you should turn on the air conditioner as well as the fan, this will make your room faster and cooler, help the air conditioner not operate with great capacity to help cool the room. Turning on the fan at the same time as the air conditioner is turned on will make the room air quickly circulate, helping the cool air flow from the air conditioner quickly spread throughout the room. After 15

minutes you can turn off the fan and let the air conditioner work alone, this time will be enough to help you enjoy the cool air from the air conditioner.

10. Should not save but buy air conditioner too cheap:

Currently on the market the air conditioner lines are very diverse from design to cost, helping users have more choices in air conditioning installation. However, when choosing air conditioner, users should also note that it is not recommended to choose cheap air conditioner or shock discount because sometimes the product quality does not guarantee you during use. In the summer, it is normal to use air conditioning 6-7 hours, if you choose a cheap air conditioner, less features will make your family's electricity bill skyrocketing, not to mention You will have to spend a lot of money to repair the damage.

11. Limit heat-generating devices in air-conditioned rooms:

You need to see which devices are generating a lot of heat, as this will make the room warmer and the air conditioner is more active. The equipment you need to pay attention to such as table lamp, light bulb, television ., you can consider to turn it off if necessary.
