Does the heater have electricity?

Oil heaters heat up the surrounding air by converting electricity into heat. When the machine starts up, the oil inside the machine will be boiled, quickly heating the heating rods and thereby radiating heat out, warming the surrounding environment. Therefore, using an oil heater will not consume too much electricity.

In addition, you do not have to worry about adding oil to heating oil because the oil in the machine has the ability to reproduce itself. Types of oil heaters of reputable brands in the market today such as FujiE, Tiross, Bluestone . all have the advantages of warming quickly, saving fuel and safe for the skin, not causing skin dryness or burning. oxygen burning.

For oil heaters, there are many different power levels and temperatures for you to choose from. The highest capacity of an oil heater is usually about 2,000W, if you want to make the bedroom reach a temperature of 27 ° C, you need to run the machine for about 1:30 minutes. So, you only need to set the machine to work for about 2 to 3 hours and you can sleep well until morning. During that time, the product will consume maximum: **3h x 2kW (capacity of the machine) = 6kWh**. Equivalent to the cost per day for using the heater to keep warm is only about 10-15,000 VND.

However, we often only use oil heaters at the highest power level in those days, for normal days you can use them at a smaller capacity or not use.

Thus, the electricity cost for using oil heaters for 1 month will not be too big for health protection for you and your loved ones in the family.

How to use an oil heater to save electricity

To ensure safe and energy-efficient use of heaters, keep in mind the following tips:

1. Select the location of the machine in a flat place, at least 1 meter away from walls and flammable objects, so that the machine does not overheat, affecting the performance during use.
2. When using an oil heater, you should adjust the temperature at 22 - 25 ° C to ensure safety for users and save power, unnecessarily high temperature increase can cause waste of electricity ability, and the large temperature difference between the indoor and outdoor environments is also not good for health. Even in families with young children, you should only leave the temperature at 22-25 ° C when using room warmers in winter.
3. It is recommended to put a basin of water in the room when using oil heaters, electric heaters, fan heaters or air conditioners so as not to create a hot, dry feeling
4. Oil heaters have the ability to quickly dry rooms during wet weather days, but do not place oil heaters in areas with overflowing water to avoid electric leakage, endangering users.

5. Open the door to make sure the room air is circulated regularly. Using heaters in enclosed spaces does not save electricity as you think.
6. In general, the choice of how much oil heaters is because the demand for each family of products is so diverse that the choice is not too difficult.

Where to buy oil heaters reputable?
