## What is Ghost Win 7?

Many people still think that "ghost win" is "installing the operating system", in fact ghost Win is the "bug / extract" action of a ghost file that has been created before.

How to create a ghost file is also very simple, when installing Windows -> just installed should operate very smoothly. We use backup software "compress" the operating system partition into a file size of 3GB -> 6GB (may be heavier and lighter).

Until the operating system malfunctions or problems, we just delete the old Windows -> "bug" this compressed file into it will have Windows like new!

With normal ghost files when backing up data / OS of any machine, it can only be used for that device.

So Freetuts will share with you the multi-configuration Ghost Win 7, suitable for most computers from the old to the new.

The ghost stage takes place quickly, preinstalling the necessary software applications for Windows -> no longer have to "manually install the operating system" anymore.
