

# eQuiz - Multiple choice test on ASP (Active Server Pages) Advance - Part 1

Welcome to the test series of TipsMake.com with topics related to the fields of information technology.

TipsMake.com - Welcome to the quiz series of TipsMake.com with topics related to the fields of information technology. And this time we will continue with a little test of the Advance ASP web programming language, in total there will be 15 questions with no time to answer each sentence.

## Some basic characteristics to know about ASP:

First of all, **ASP.NET** is **Active Server Pages .NET** ( **.NET** here is **.NET framework** ). Simply and briefly, ASP.NET is a revolutionary technology used to develop network applications today as well as in the future. You note that ASP.NET is an organizational method or **framework** to set up very popular applications for the network based on **CLR (Common Language Runtime)** rather than a programming language. . Visual programming language used to express ASP.NET is **VB.NET ( Visual Basic .NET )** and **VB.NET** is just one of the 25 .NET languages ??currently used to develop ASP.NET pages.

Although similar to classic ASP, ASP.NET is not ASP. We outline here some differences between ASP.NET and ASP for you to have a general concept and will give more details when digging into each feature of

ASP.NET.

## **Difference between ASP.NET and ASP:**

ASP.NET is sketched ( **re-design** ) from zero, it is changed to the roots and develop ( **develop** ) in accordance with current requirements as well as a solid direction for the future. The main reason is that Microsoft has been so frustrated in adding and incorporating new uses into a classic design or network design model that **Microsoft** thinks it's best to redo a completely new model instead of changing this place somewhere into ASP. That is not to mention many of the later inventions based on new concepts in the current development trend of **Information Technology that** need to be included in that new development model. Thus, we can say that ASP.NET is not ASP. Indeed, ASP.NET provides a completely different approach to ASP methods.

Note:

Although ASP.NET and ASP are different, they can work together in your Web Server (running **side-by-side** ). Therefore, when you install the ASP.NET engine, you do not need to reprogram existing applications in your ASP form, but if you want, you can do it very easily.

Good luck!
