

Evernote is about to enter the smart wearable device market

Evernote is the most used note-taking application on Android. This application not only allows you to annotate character lines, but you can take notes with images, sounds, and office files as well. And now Evernote is developing apps for Android Wear devices.

Evernote is the most used note-taking application on Android. This application not only allows you to annotate character lines, but you can take notes with images, sounds, and office files as well. And now Evernote is developing apps for Android Wear devices.

Currently, *Evernote* developers are developing algorithms to bring this application to Android Wear devices. Once this application is officially released, viewing the notes, reviewing the list of jobs, or announcements will become more convenient without having to remove the phone from the bag as before. and here.

In addition to *Evernote* that will support **Android Wear devices** , in this version of the app will support more new features to support users.

Evernote is really attentive to users as they develop an application that meets the needs of so many users.
