

Evernote refreshes the web-based interface

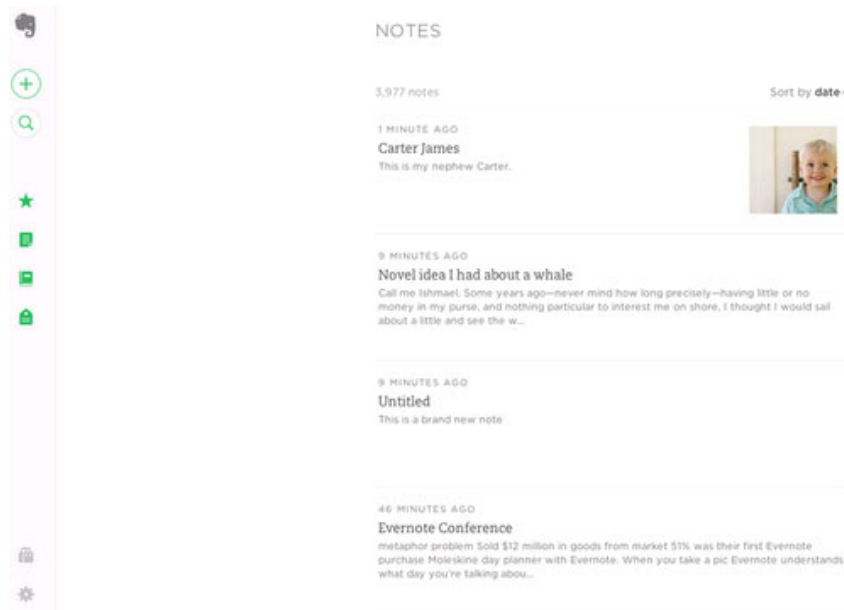

Evernote on October 3 renewed its web-based version to eliminate factors that could distract users during use.

Evernote on October 3 renewed its web-based version to eliminate factors that could distract users during use.

The buttons on *Evernote* have been designed to be minimal and do not appeal to your eyes in the notes editing process, but the previous dark blue and gray menus are also not available. Even buttons to insert bullet points, tick marks, text formatting tools will also be hidden by default. Only when you select a paragraph to manipulate will these menus appear. You can still access notebooks, notes, tags and other features fully.

Currently the new version of Evernote is only in beta, so when you visit <https://www.evernote.com> and log in, you will be asked if you want to test. Today's change comes after the company has updated its mobile apps with a streamlined and neat interface.

Also on this occasion, *Evernote* introduced a new chat feature in its note application. Named *Work Chat*, this tool will help communication team workers more effectively while working with Evernote.

Users not only see who is viewing the note but also know they are watching with a mobile device or computer. Work Chat will be deployed on all platforms that Evernote will be available later this year.
