

Experience Xiaomi 11T Pro: Snapdragon 888 chip, 120W fast charging

Xiaomi 11T Pro owns many strengths such as high configuration, buffalo battery, beautiful screen and good camera.

The overall appearance of the Xiaomi 11T Pro bears a lot of similarities with the Poco F3. Still a familiar design with a rectangular camera cluster and a curved back at the edges, providing a firm, hand-holding experience. However, this design is somewhat boring, more like mid-range products than a device in the high-end segment. In addition, due to its large size and rather heavy weight, using the device with one hand for a long time will be relatively difficult, especially for users with small hands.

The fingerprint sensor of the device is integrated with the power key, instead of being placed under the screen like many other products in the same segment.

The front is a 6.67-inch punch-hole screen with a resolution of 1,080 x 2,400 pixels, using an AMOLED panel, capable of displaying one billion colors. The quality of this screen is relatively good, the colors are quite vibrant, fresh, with high brightness and contrast. Another plus point is that this screen supports 120 Hz refresh rate, providing a fairly smooth visual feeling.

The device is equipped with a 3-camera cluster with a 108MP main lens, an 8MP ultra-wide-angle lens and a 5MP telephoto lens. The selfie camera of the device has a resolution of 16 MP. This camera system for the speed of focusing and capturing and saving images is quite fast.

The quality of photos taken from this camera cluster is relatively good. Even in bright enough conditions, the captured image has high detail, and the colors are reproduced in a more vibrant direction than in reality. Portrait mode also works well, the subject is separated from the background quite naturally. When recording videos, the device also has relatively good anti-shake capabilities, stable frames. However, the recording microphone does not work effectively when it collects a lot of noise.

Xiaomi 11T Pro is equipped with Snapdragon 888 processor, 12 GB RAM capacity and 256 GB internal memory. The machine can meet all entertainment needs as well as play heavy games. However, during continuous gaming for about an hour, the back near the camera cluster was slightly warm, and the screen brightness was also reduced. However, this does not affect the user experience too much.

Xiaomi 11T Pro is equipped with a high-capacity 5,000 mAh battery, integrated with 120W fast charging technology. This is also one of the fastest charging smartphones on the market. The actual charging experience from 0-100% only takes about 18 minutes. In addition, the plus point is that the temperature of the device is maintained relatively stable, does not heat up much during the charging process.
